3 GROUND IMPROVEMENT USING GRANULAR PILES	57
3.1 General	57
3.2 <u>Methods of granular pile construction</u>	57

3.3	Engineering behavior of composite ground	61
3.4	Ultimate bearing capacity of single, isolated granular piles	64
3.5	Ultimate bearing capacity of granular pile groups	66
3.6	Settlement of the composite ground	69
3.7	Slope stability of the composite ground	69
3.8	Rate of primary consolidation settlement	75
3.9	Strength increase of clay due to consolidation	76
3.10	Secondary settlement	76
3.11	Full scale load tests on granular piles	77
3.12	Test embankment on granular piles	79
3.13	Performance of granular piles under embankment loading	83
3.14	Model infrastructure projects on soft ground	85
3.15	Future outlook for granular piles	86
3.16	Granular piles in combination with other soil improvement techniques	89
3.17	Conclusions	93
	References	94
	Appendix	96
4	LIME/CEMENT DEEP MIXING METHOD	99
4.1	General	99
4.2	Method of construction and subsequent soil reactions	99
4.3	Relevant characteristics of soft Bangkok clay	100
4.4	Effects of quicklime, natural water content, salt and organic contents	101
4.5	Dry jet mixing method	103
4.6	Wet jet mixing method	104
4.7	Lime/cement stabilization of soft Bangkok clay	106
4.8	Test embankment on DMM improved soft Bangkok clay	107
4.9	Calculation methods for lime columns	108
4.10	Calculation methods for deep cement mixing (DCM)	121
4.11	Conclusions	127
	References	128
5	MECHANICALLY STABILIZED EARTH (MSE) EMBANKMENTS/WALLS	131
5.1	General	131
5.2	Relevance to development	132
5.3	MSE embankment/wall on soft ground	133
5.4	Design criteria for MSE structures	135
5.5	Theoretical background for design MSE structures	135
5.6	Pullout resistance of steel grid in poor quality backfill	152
5.7	The behavior of MSE structures on soft ground	172
5.8	Modelling of MSE structures on soft ground	179

5.9	Finite element results of MSE wall/embankment on soft ground	194
5.10	Present and future outlook of MSE system	214
5.11	Conclusions	216
