

A First Course on
WAVELETS

Eugenio Hernández
Universidad Autónoma de Madrid

Guido Weiss
Washington University in St. Louis

CRC PRESS

Boca Raton London New York Washington, D.C.

Contents

- 1 Bases for $L^2(\mathbb{R})$**
 - 1.1 Preliminaries
 - 1.2 Orthonormal bases generated by a single function; the Balian-Low theorem
 - 1.3 Smooth projections on $L^2(\mathbb{R})$
 - 1.4 Local sine and cosine bases and the construction of some wavelets
 - 1.5 The unitary folding operators and the smooth projections
 - 1.6 Notes and references

- 2 Multiresolution analysis and the construction of wavelets**
 - 2.1 Multiresolution analysis
 - 2.2 Construction of wavelets from a multiresolution analysis
 - 2.3 The construction of compactly supported wavelets
 - 2.4 Better estimates for the smoothness of compactly supported wavelets
 - 2.5 Notes and references

- 3 Band-limited wavelets**
 - 3.1 Orthonormality
 - 3.2 Completeness

- 3.3 The Lemarié-Meyer wavelets revisited
- 3.4 Characterization of some band-limited wavelets
- 3.5 Notes and references
- 4 Other constructions of wavelets**
 - 4.1 Franklin wavelets on the real line
 - 4.2 Spline wavelets on the real line
 - 4.3 Orthonormal bases of piecewise linear continuous functions for $L^2(\mathbb{T})$
 - 4.4 Orthonormal bases of periodic splines
 - 4.5 Periodization of wavelets defined on the real line
 - 4.6 Notes and references
- 5 Representation of functions by wavelets**
 - 5.1 Bases for Banach spaces
 - 5.2 Unconditional bases for Banach spaces
 - 5.3 Convergence of wavelet expansions in $L^p(\mathbb{R})$
 - 5.4 Pointwise convergence of wavelet expansions
 - 5.5 H^1 and BMO on \mathbb{R}
 - 5.6 Wavelets as unconditional bases for $H^1(\mathbb{R})$ and $L^p(\mathbb{R})$ with $1 < p < \infty$
 - 5.7 Notes and references
- 6 Characterizations of function spaces using wavelets**
 - 6.1 Wavelets and sampling theorems
 - 6.2 Littlewood-Paley theory
 - 6.3 Necessary tools
 - 6.4 The Lebesgue spaces $L^p(\mathbb{R})$ with $1 < p < \infty$
 - 6.5 The Hardy space $H^1(\mathbb{R})$
 - 6.6 The Sobolev spaces $L^{p,s}(\mathbb{R})$, $1 < p < \infty$, $s = 1, 2, 3, \dots$
 - 6.7 The Lipschitz spaces $\Lambda_\alpha(\mathbb{R})$, $0 < \alpha < 1$, and the Zygmund class $\Lambda_*(\mathbb{R})$

6.8 Notes and references

7 Characterizations in the theory of wavelets

7.1 The basic equations

7.2 Some applications of the basic equations

7.3 The characterization of MRA wavelets

7.4 A characterization of low-pass filters

7.5 A characterization of scaling functions

7.6 Non-existence of smooth wavelets in $H^2(\mathbb{R})$

7.7 Notes and references

8 Frames

8.1 The reconstruction formula for frames

8.2 The Balian-Low theorem for frames

8.3 Frames from translations and dilations

8.4 Smooth frames for $H^2(\mathbb{R})$

8.5 Notes and references

9 Discrete transforms and algorithms

9.1 The discrete Fourier transform (DFT) and the fast Fourier transform (FFT)

9.2 The discrete cosine transform (DCT) and the fast cosine transform (FCT)

9.3 The discrete version of the local sine and cosine bases

9.4 Decomposition and reconstruction algorithms for wavelets

9.5 Wavelet packets

9.6 Notes and references

References
