Contents

Preface	ix
Chapter I. Evolution Inclusions Involving Monotone Coercive Operators	1
Introduction	1
1. Mathematical Preliminaries	2
2. Existence and Relaxation Theorems	18
3. Properties of the Solution Set	48
4. Evolution Inclusions with Constraints	65
5. Periodic Solutions	77
6. Continuous Dependence Results	86
7. Applications	95
8. Remarks	105
Chapter II. Evolution Inclusions of the Subdifferential Type	115
Introduction	115
1. Existence and Relaxation Results for Regular Initial Data	116
2. Properties of the Solution Set	136
3. Continuous Dependence Results	140
4. Evolution Inclusions Involving Opposite Monotonicities	153
5. Doubly Nonlinear Evolution Equations	168
6. Applications	184
7. Remarks	197
Chapter III. Special Topics in Differential and Evolution Inclusions	205
Introduction	205
1. Differential Inclusions in R^N	206
2. Boundary Value Problems for Differential Inclusions in R^N	231
3. Evolution Inclusions Involving m -Accretive Operators	251
4. Volterra Integral Inclusions	267
5. Reachable Sets and Variational Inclusions	297
6. Ode's and Pde's with Discontinuities	307
7. Remarks	343
Chapter IV. Optimal Control	351
Introduction	351
1. Existence Theory	353
2. Relaxation of Control Systems	375
3. Variational Stability of Optimal Control Problems	415
4. Necessary Conditions for Optimality	442
5. Controllability of Infinite Dimensional Systems	479

6. Remarks	499
Chapter V. Calculus of Variations	509
Introduction	509
1. Lower Semicontinuity Results	510
2. Existence Theorems	528
3. Relaxation Results	540
4. Well-Posedness Results	554
5. Duality Theory	566
6. Homogenization	583
7. Remarks	589
Chapter VI. Mathematical Economics	595
Introduction	595
1. Existence Theory for Growth Models	596
2. Price Characterization of Optimal Programs	616
3. Models With Recursive Utility	630
4. Discrete-Time Stochastic Growth Models	637
5. Continuous-Time Stochastic Dynamics	659
6. Portfolio Theory and Financial Economics	673
7. Equilibria in Exchange Economics	685
8. Remarks	696
Chapter VII. Stochastic Games	705
Introduction	705
1. Semicontinuous Nonstationary Stochastic Games	707
2. Discounted Stochastic Games	718
3. Discrete Time Controlled Markov Processes	729
4. Continuous Time Stochastic Dynamic Programming	741
5. Adaptive Control	753
6. Cournot-Nash Equilibria	769
7. Remarks	785
Chapter VIII. Special Topics in Mathematical Economics and Optimization	791
Introduction	791
1. Resource Allocation Problems	792
2. Convergence of Information	806
3. Cooperative Behavior of Firms	826
4. Revealed Preference and Expected Utility	837
5. Nonconvex Duality with Applications	845
6. Pareto Optimization	853
7. Remarks	859
Appendix	863
References	871
Symbols	919
Index	921
Errata of Volume A	925

Preface

In volume I we developed the tools of “Multivalued Analysis.” In this volume we examine the applications. After all, the initial impetus for the development of the theory of set-valued functions came from its applications in areas such as control theory and mathematical economics. In fact, the needs of control theory, in particular the study of systems with a priori feedback, led to the systematic investigation of differential equations with a multivalued vector field (differential inclusions). For this reason, we start this volume with three chapters devoted to set-valued differential equations. However, in contrast to the existing books on the subject (i.e. J.-P. Aubin - A. Cellina: “Differential Inclusions,” Springer-Verlag, 1983, and Deimling: “Multivalued Differential Equations,” W. De Gruyter, 1992), here we focus on “Evolution Inclusions,” which are evolution equations with multivalued terms. Evolution equations were raised to prominence with the development of the linear semigroup theory by Hille and Yosida initially, with subsequent important contributions by Kato, Phillips and Lions. This theory allowed a successful unified treatment of some apparently different classes of nonstationary linear partial differential equations and linear functional equations. The needs of dealing with applied problems and the natural tendency to extend the linear theory to the nonlinear case led to the development of the nonlinear semigroup theory, which became a very effective tool in the analysis of broad classes of nonlinear evolution equations. This nonlinear breakthrough was achieved with the advent of the theory of operators of monotone type.

In the first two chapters, we deal with two large classes of evolution inclusions. The first class involves operators of monotone type which are coercive and defined in the context of an evolution triple. The second class involves subdifferential operators defined on Hilbert spaces and is suitable for the analysis of systems with unilateral constraints. The third chapter is a pot-pouri of topics from the theory of differential and evolution inclusions. Among other things, we discuss second order nonlinear multivalued boundary value problems and problems with discontinuities, which have been the focus of intense research activity in the last decade. After the chapters on the multivalued differential equations, in chapter 4 we turn to optimal control problems for infinite dimensional systems. Since most lumped parameter systems (finite dimensional systems) are approximations of distributed parameter systems, the study of infinite dimensional systems, such as control systems governed by partial differential equations or functional equations, are both of intrinsic interest and important in a great variety of applications.

We treat systems driven by elliptic, parabolic and evolution equations, and we go beyond optimal control theory by examining the controllability properties of nonlinear systems using the tools of operator theory. Optimal control theory grew out of the theory of calculus of variations. Calculus of variations is a subject as old

as calculus itself. Together with optimal control theory and optimization theory, calculus of variations spans a large area of mathematical analysis, known as “theory of extremal problems.” Recently there has been a renewal of interest in the classical problems, in particular in vectorial problems. Chapter 5 surveys some of these developments and underscores the significant role that multivalued analysis has in the investigation of variational problems. In chapter 6 we pass to a related class of dynamic optimization problems, which represent models of economic dynamics and the intertemporal distribution of resources. We consider both deterministic and stochastic models, in discrete and continuous time. Primarily, we are interested in two types of results: existence theorems for “optimal” programs and theorems characterizing such programs via a system of prices. It is important to stress that the models considered here are extreme idealizations. In this way we are able to build a sufficiently complete mathematical theory. Nevertheless, the main ideas and methods pervade the broad spectrum of concrete economic problems. The built-in “uncertainty” in the evolution of such systems leads naturally to set-valued dynamics and so, the theory of multivalued analysis plays a prominent role. At the end of the chapter (section 6.7) we discuss static models and in particular we investigate some central issues of modern equilibrium theory.

Chapter 7 stands at the interface of probability theory, optimal control theory, and mathematical economics. Probability theory began in the seventeenth century (at approximately the same time with calculus). However, only in the middle of this century, did mathematicians develop the tools to deal with the problems of maximizing the chances of winning against an intelligent opponent. These tools stand in the core of modern stochastic control and stochastic games. Chapter 7 surveys some aspects of these theories. Finally, in chapter 8 we have gathered various applications from optimization theory and mathematical economics, in which multivalued analysis and its byproducts are indispensable tools.

Needless to say, the list of applications is not exhaustive. Moreover, the same is true of our treatment of each subject. There are certainly several omissions which the experienced reader will spot easily. Nevertheless, we hope that with this volume we have given a pretty good idea of the many applications that the tools and methods of multivalued analysis have found in the last four decades. With the information this volume provides, the reader will be able to pursue in greater detail and depth the study of the particular applications and models that may interest him. Closing this project, we can safely claim that the message is loud and clear: “Multivalued Analysis” is a very prolific branch of modern mathematical analysis, with fascinating theory and numerous important applications in physical, economic, and engineering problems.

It is a great pleasure to acknowledge a debt of personal gratitude to those who helped us with this difficult project. The first author wishes to express his deep gratitude to his high-school mathematical teacher Mr. Chaoqian Zong who brought him to the kingdom of mathematics; to Professors Yubo Chen and Wang Zhuang who helped him build a sound background in analysis; to Professor Klaus Deimling who introduced to him the fascinating world of the multivalued; and to Professor V. Lakshmikantham who helped him in diverse fields ranging from mathematics to philosophy. He further thanks Professors Lynn Erbe and Mitsuharu Otani for inviting him to their institutions to present talks purporting to this project.

The second author wishes to thank F. DeBlasi who was a constant source of inspiration and encouragement. He considers himself very fortunate to have a friend of the intellectual and moral caliber of F. DeBlasi. He is also indebted to his very good friends and collaborators from Perugia (Italy): A. Fiacca, F. Papalini, T. Cardinali; and from Krakow (Poland): Z. Denkowski, S. Migorski, L. Gasinski. The frequent visits in those two beautiful cities gave him the opportunity to present and develop parts of the material of this volume. Moreover, he would like to record his debt to his close friends and colleagues in Greece: E. Avgerinos, Ch. Koukouvinos, M. Mitrouli, N. Halidias, N. Kourogenis, and N. Yannakakis, for their continuous support. Finally, many thanks are also due to N.U. Ahmed, S. Aizicovici, R. Aliprantis, A. Kartsatos, U. Ledzewicz, and G. Pianigiani.
