

A TREATISE ON THE CIRCLE AND THE SPHERE

BY

JULIAN LOWELL COOLIDGE, PH.D.

**ASSISTANT PROFESSOR OF MATHEMATICS IN
HARVARD UNIVERSITY**

AMS CHELSEA PUBLISHING

American Mathematical Society • Providence, Rhode Island

CONTENTS

CHAPTER I

THE CIRCLE IN ELEMENTARY PLANE GEOMETRY

§ 1. Fundamental Definitions and Notation

	PAGE
Fundamental definitions and notation	19

§ 2. Inversion

Inversion	21
Anallagmatic curves	24
Inverse of a circle or line	26
Centres of similitude	27
Relations between mutually inverse circles	30

§ 3. Mutually Tangent Circles

Poristic systems	31
Simultaneous invariant of two circles	36
Four circles tangent to a fifth	37
Feuerbach's theorem	39
Hart circles	42

§ 4. Circles related to a Triangle

Circles inscribed or circumscribed to a triangle or quadrilateral	44
Pedal circles and Simson lines	48
Isogonally conjugate points	49
Fontené's extension of Feuerbach's theorem	52
Nine-point circle and <i>P</i> circle	53
Further relations connecting circumscribed circles, nine-point circles, and Simson lines	58

§ 5. The Brocard Figures

Brocard points and angles	60
Relation to symmedian point	65
Tucker circles, special cases	68
Brocard circle	75
Three similar figures	81
MacKay circles	83

§ 6. Concurrent Circles and Concyelic Points

	PAGE
Miquel's theorems	85
Circles associated with n lines in a plane	90

§ 7. Coaxal Circles

Radical axis	95
Coaxal circles	98
Radical centre	100
Ratio theorem for coaxal circles	103
Radical circles, and circles of similitude	106
Circles intersecting given circles at given angles	108
Circles intersecting given circles at equal angles	110
Suggestions	112

CHAPTER II

THE CIRCLE IN CARTESIAN PLANE GEOMETRY

§ 1. The Circle studied by means of Trilinear Coordinates

Trilinear coordinates, circumscribed circle	114
Inscribed and escribed circles	115
Nine-point circle	120
Nine-point circles of four points, Fontené's theorem	123
Notable points of the triangle, Tucker circles	123
Brocard circle	125
Schoute's theorem connecting Brocard circle and angle	127
Neuberg circle, MacKay circles	128

§ 2. Fundamental Relations, Special Tetracyclic Coordinates

Types of circle in the cartesian plane	129
Powers, distances, and angles	131

§ 3. The Identity of Darboux and Frobenius

Relation connecting ten coplanar circles, special cases	135
Relations connecting four mutually orthogonal circles, general tetracyclic coordinates	139
Circles circumscribed to an arcual triangle	141
Circles cutting three given circles at given angles, reality of solutions	143
Circles cutting four circles at equal or supplementary angles	145
Circles touching three others, Hart systems	145

§ 4. Analytic Systems of Circles

	PAGE
Coaxal circles	152
Series of circles, osculating circles	156
Congruences of circles	160
Quadric congruences	161
Suggestions	165

CHAPTER III

FAMOUS PROBLEMS IN CONSTRUCTION

Lemoine's geometrographic criteria	166
Problem of Apollonius, number of real solutions	167
Construction of Apollonius	168
Construction of Gergonne	171
Steiner's problem	173
Circle meeting four others at equal or supplementary angles	174
Malfatti's problem, Hart's proof of Steiner's construction	174
Analytic solution, extension to thirty-two cases	177
Examples of Fiedler's general cyclographic methods	183
Mascheroni's geometry of the compass	186

CHAPTER IV

THE TETRACYCLIC PLANE

§ 1. Fundamental Theorems and Definitions

Definitions, point, circle, angle, isotropic, inversion	189
Relation to cartesian plane and sphere	191
Problems of construction, problem of Apollonius	195
Relation to bilinear imaginary forms	201

§ 2. Cyclics

Cyclics, classification	203
General cyclic, cartesian cyclic	204
Modes of generation, foci and double foci	207
Covariant cyclics, invariant cross ratios	209
Osculating circles	214
Residuation theorems	215
Parametric representation in elliptic coordinates	219
Confocal cyclics	221
Differential equation of confocal cyclics, equiharmonic and harmonic cases	222
Suggestions	225

CHAPTER V

THE SPHERE IN ELEMENTARY GEOMETRY

§ 1. Miscellaneous Elementary Theorems

	PAGE
Definitions	226
Inversion in three dimensions	227
Centres of similitude	230
Isogonal conjugates, pedal spheres	232
Sixteen-point sphere	234
Twelve-point sphere, general case	237
Twelve-point sphere, special cases	237
Orthogonal systems	239
Concurrent spheres and cospherical points	240

§ 2. Coaxal Systems

Coaxal systems and linear congruences	241
Special cases	243
Spheres cutting others at given angles	245
Sphere cutting five others at equal or supplementary angles	246
Problem of Apollonius	246
Suggestions	247

CHAPTER VI

THE SPHERE IN CARTESIAN GEOMETRY

§ 1. Coordinate Systems

Tetrahedral coordinates, circumscribed sphere, general sphere	248
Types of sphere in cartesian space	250
Special pentaspherical coordinates	251

§ 2. Identity of Darboux and Frobenius

Identity connecting twelve spheres, special cases	253
Orthogonal systems, general pentaspherical coordinates	257
Spheres circumscribing spherical tetrahedra	257
Sphere meeting five others at equal or supplementary angles	258
Sphere tangent to four others	261
Concurrent spheres, cospherical points	262

§ 3. Analytic Systems of Spheres

	PAGE
Series of spheres, general conic series	263
Dupin series, Dupin cyclide	264
Cubic series, quartic series	270
Linear congruence, quadric congruence	273
Linear complex, quadratic complex	275
Homothetic and confocal quadratic complexes	278
Rational cubic complex	280
Suggestions	282

CHAPTER VII

PENTASPHERICAL SPACE

§ 1. Fundamental Definitions and Theorems

Definitions, point, sphere, angle, inversion	283
Pentasppherical space and cartesian space	285

§ 2. Cyclides

Cyclides, general remarks	286
General cyclide, fivefold generation	287
Tangent spheres, focal curves, normals to cartesian cyclide	288
Covariant surface	289
Residuation theorems	294
Properties of generating spheres of one system	294
Transformation from quadric to cartesian cyclide	295
Cyclides subject to eight or nine conditions	296
Cartesian cyclide, properties of deferent	298
Centres of cyclide, cartesian equation	299
Special cyclides, Dupin cyclides	300
Confocal cyclides, orthogonal systems	302
Suggestions	305

CHAPTER VIII

CIRCLE TRANSFORMATIONS

§ 1. General Theory

General transformations, circle to circle, Cremona transformations	306
Circular transformations in narrower sense, types in the real euclidean domain	308

	PAGE
Factorization of circular transformations, direct and indirect conformal transformations	310
Invariance of double angle and double ratio	313
Circles in bi-involution	314
Involutory transformations	316

§ 2. Analytic Treatment

Analytic expression for real circular transformations of the sphere	318
Direct transformations, self-corresponding points	319
Hyperbolic, elliptic, parabolic, and loxodromic types	321
Problems in construction connected with direct transformations of sphere or tetracyclic plane	323
Indirect transformations, hyperbolic, elliptic, and parabolic types	324
Commutative transformations	327

§ 3. Continuous Groups of Transformations

Continuous groups of direct transformations, enumeration and description	330
Suggestions	335

CHAPTER IX

SPHERE TRANSFORMATIONS

§ 1. General Theory

General sphere to sphere transformation	336
Liouville's theorem	338
Double ratios	338
Direct and indirect transformations	339
Types of direct conformal collineations	341
Types of direct spherical transformations not equivalent to collineations	341
Types of indirect transformations	346

§ 2. Continuous Groups

Enumeration of continuous groups	348
Parametric representation of quinary orthogonal substitutions	349
Suggestions	350

CHAPTER X

THE ORIENTED CIRCLE

§ 1. Elementary Geometrical Theory

	PAGE
Concept of the oriented circle	351
Oriented circles in elementary geometry	352
Power of oriented line with regard to oriented circle	353
Duality in circle geometry	355
Laguerre inversions	356
Miscellaneous theorems about oriented lines	357

§ 2. Analytic Treatment

Coordinates of oriented circles and lines	358
Analytic expression for Laguerre inversions	359
Twelve-circle identity	360
Residuation theorems	362

§ 3. Laguerre Transformations

Minimal projection	367
Dual coordinates, equiangular transformations	370
Laguerre transformations, fundamental invariants	372

§ 4. Continuous Groups

Continuous groups of Laguerre transformations	383
---	-----

§ 5. Hypercyclics

Hypercyclics, various generations	385
Deferents, definition by means of anticaustics	388
Plücker numbers, residuation theorems	389

§ 6. The Oriented Circle Treated Directly

Oriented circles, linear congruences	393
Invariants of linear congruences, congruences in involution	396
Inversion in linear congruence	397
New coordinates for oriented circle	399
Differential theorems about congruences and series of oriented circles	400
Quadratic congruence, singular curve	404
Suggestions	407

CHAPTER XI

THE ORIENTED SPHERE

§ 1. Elementary Geometrical Theorems

	PAGE
General concept of oriented sphere	408
Oriented spheres and planes in elementary geometry	409
Laguerre inversions	409

§ 2. Analytic Treatment

Coordinates of oriented spheres and planes	410
Residuation theorems	412
Minimal projection	413
Laguerre group	415
Equilong transformations	416
Reduction of Laguerre transformations to Laguerre inversions	422

§ 3. The Hypercycloide

Hypercyclides, various generations	424
Deferents, anticaustic properties	425
Singular curve, residuation properties	426

§ 4. The Oriented Sphere Treated Directly

Linear complex of oriented spheres	428
Invariants of linear complex, complexes in involution	430
Inversion in linear complex	431
New coordinates for oriented spheres	433

§ 5. Line-sphere Transformation

Lie's line-sphere transformation	434
--	-----

§ 6. Complexes of Oriented Spheres

Differential theorems about complexes, congruences, and series	440
Quadratic complex of oriented spheres	443
Singular surface, lines of curvature	444
Suggestions	446

CHAPTER XII

CIRCLES ORTHOGONAL TO ONE SPHERE

§ 1. Relations of two Circles

	PAGE
Foci of circles, cospherical circles	448
Circles in involution and bi-involution	449
Circles cospherical and orthogonal to two given circles	450
Angle of two circles	452
Paratactic circles	452

§ 2. Circles Orthogonal to one Sphere

Plücker coordinates, line circle transformation	453
Linear complex, fundamental properties	458
Metrical invariant of linear complex, canonical form	459
Polarization in linear complex	461
Differential theorems concerning complexes, congruences, and series of circles	462

§ 3. Systems of Circle Crosses

Axial cross of linear complex, coordinates of cross	464
One parameter families of crosses, cyclides and pseudo-cylindroids	465
Two parameter families of crosses	470
General chain congruence of crosses	471
Suggestions	473

CHAPTER XIII

CIRCLES IN SPACE, ALGEBRAIC SYSTEMS

§ 1. Coordinates and Identities

Circles in three dimensions and lines in four dimensions	474
Plücker coordinates of a circle, five fundamental identities	475
Second form for Plücker coordinates	477
Metrical invariants of two circles	478
Pentacycle of Stephanos	482
Figure of fifteen associated circles	483
Pentacycle treated analytically	485

§ 2. Linear Systems of Circles

	PAGE
Linear hypercomplex, general theorems	487
Metrical definition of linear hypercomplex	490
Special types	491
Rational systems in linear hypercomplex	494
Pencil of linear hypercomplexes, linear hypercongruence	494
Special types of linear hypercongruence	496
Net of linear hypercomplexes, linear complex	497
Congruence of central spheres of linear complex	498
Linear congruence, surface of foci, and focal surface	502
Complex of spheres through circles of linear congruence	503
Special types of linear congruence	506
Linear series, surface generated thereby	506

§ 3. Other Simple Systems

Congruence of the third order and sixth class	509
Congruences of the first class	515
Involutory circle transformation	516
Suggestions	520

CHAPTER XIV

THE ORIENTED CIRCLE IN SPACE

§ 1. Fundamental Relations

Preliminary definitions and formulae	521
Linear spaces in the S_6^{10} of oriented circles	525

§ 2. Linear Systems

Linear hypercomplex	526
Linear hypercongruence	529
Linear complex	530
Linear congruence	532
Linear series	534

§ 3. The Laguerre Method of Representing
Imaginary Points

Laguerre's representation	535
Representation of a chain	536
Condition that a congruence of oriented circles should represent the points of a curve	540

CONTENTS

17

	PAGE
Representation of an isotropic	541
Representation of a circle	542
Representation of a sphere	543
Suggestions	545

CHAPTER XV

DIFFERENTIAL GEOMETRY OF CIRCLE SYSTEMS

§ 1. Differential Geometry of the S_0^5 of all Circles

Differential geometry of the circle continuum	546
Linear systems in the S_0^5 of all circles	546
Differential properties of series, congruences, complexes, hypercongruences, and hypercomplexes of circles	547

§ 2. Parametric Method for Circle Congruences

Parametric representation of a circle	552
Conditions for normal congruence	553
Focal congruences	555
Normal congruences and triply orthogonal systems	558
Normal congruences associated with given surfaces	568

§ 3. The Kummer Method

Fundamental coefficients	571
Circles cospherical and orthogonal to a circle and its next neighbours	572
Focal and normal congruences	576
Pseudo-normal congruences	578
Conformal congruences	583

§ 4. Complexes of Circles

Kummer method applied to complexes	586
Pseudo-normal complexes	590
Conformal complexes	592
Suggestions	593
Subject Index	594
Index of Proper Names	601
