

# Principles of Optics

---

MAX BORN

MA, Dr Phil, FRS

Nobel Laureate

*Formerly Professor at the Universities of Göttingen and Edinburgh*

and

EMIL WOLF

PhD, DSc

*Formerly Wilson Professor of Optical Physics, University of Rochester, NY*

with contributions by

A. B. BHATIA, F. C. CLEMMOW, D. GABOR, A. R. STOKES,

A. M. TAYLOR, P. A. WAYMAN AND W. L. WILCOCK

Foreword by Sir Peter Knight

**SEVENTH ANNIVERSARY EDITION**

60TH ANNIVERSARY OF FIRST EDITION

20TH ANNIVERSARY OF SEVENTH EDITION

|--------------------------------------------------------------------------------------|-----------|
| Foreword by Sir Peter Knight                                                         | v         |
| Historical introduction                                                              | xxix      |
| <b>I Basic properties of the electromagnetic field</b>                               | <b>1</b>  |
| 1.1 The electromagnetic field                                                        | 1         |
| 1.1.1 Maxwell's equations                                                            | 1         |
| 1.1.2 Material equations                                                             | 2         |
| 1.1.3 Boundary conditions at a surface of discontinuity                              | 4         |
| 1.1.4 The energy law of the electromagnetic field                                    | 7         |
| 1.2 The wave equation and the velocity of light                                      | 11        |
| 1.3 Scalar waves                                                                     | 14        |
| 1.3.1 Plane waves                                                                    | 15        |
| 1.3.2 Spherical waves                                                                | 16        |
| 1.3.3 Harmonic waves. The phase velocity                                             | 16        |
| 1.3.4 Wave packets. The group velocity                                               | 19        |
| 1.4 Vector waves                                                                     | 24        |
| 1.4.1 The general electromagnetic plane wave                                         | 24        |
| 1.4.2 The harmonic electromagnetic plane wave                                        | 25        |
| (a) Elliptic polarization                                                            | 25        |
| (b) Linear and circular polarization                                                 | 29        |
| (c) Characterization of the state of polarization by Stokes parameters               | 31        |
| 1.4.3 Harmonic vector waves of arbitrary form                                        | 32        |
| 1.5 Reflection and refraction of a plane wave                                        | 38        |
| 1.5.1 The laws of reflection and refraction                                          | 38        |
| 1.5.2 Fresnel formulae                                                               | 40        |
| 1.5.3 The reflectivity and transmissivity; polarization on reflection and refraction | 43        |
| 1.5.4 Total reflection                                                               | 49        |
| 1.6 Wave propagation in a stratified medium. Theory of dielectric films              | 54        |
| 1.6.1 The basic differential equations                                               | 55        |
| 1.6.2 The characteristic matrix of a stratified medium                               | 58        |
| (a) A homogeneous dielectric film                                                    | 61        |
| (b) A stratified medium as a pile of thin homogeneous films                          | 62        |
| 1.6.3 The reflection and transmission coefficients                                   | 63        |
| 1.6.4 A homogeneous dielectric film                                                  | 64        |
| 1.6.5 Periodically stratified media                                                  | 70        |
| <b>II Electromagnetic potentials and polarization</b>                                | <b>75</b> |
| 2.1 The electrodynamic potentials in the vacuum                                      | 76        |

|            |                                                                                                        |     |
|------------|--------------------------------------------------------------------------------------------------------|-----|
| 2.1.1      | The vector and scalar potentials                                                                       | 76  |
| 2.1.2      | Retarded potentials                                                                                    | 78  |
| 2.2        | Polarization and magnetization                                                                         | 80  |
| 2.2.1      | The potentials in terms of polarization and magnetization                                              | 80  |
| 2.2.2      | Hertz vectors                                                                                          | 84  |
| 2.2.3      | The field of a linear electric dipole                                                                  | 85  |
| 2.3        | The Lorentz-Lorenz formula and elementary dispersion theory                                            | 89  |
| 2.3.1      | The dielectric and magnetic susceptibilities                                                           | 89  |
| 2.3.2      | The effective field                                                                                    | 90  |
| 2.3.3      | The mean polarizability; the Lorentz-Lorenz formula                                                    | 92  |
| 2.3.4      | Elementary theory of dispersion                                                                        | 95  |
| 2.4        | Propagation of electromagnetic waves treated by integral equations                                     | 103 |
| 2.4.1      | The basic integral equation                                                                            | 104 |
| 2.4.2      | The Ewald-Oseen extinction theorem and a rigorous derivation of the Lorentz-Lorenz formula             | 105 |
| 2.4.3      | Refraction and reflection of a plane wave, treated with the help of the Ewald-Oseen extinction theorem | 110 |
| <b>III</b> | <b>Foundations of geometrical optics</b>                                                               | 116 |
| 3.1        | Approximation for very short wavelengths                                                               | 116 |
| 3.1.1      | Derivation of the eikonal equation                                                                     | 117 |
| 3.1.2      | The light rays and the intensity law of geometrical optics                                             | 120 |
| 3.1.3      | Propagation of the amplitude vectors                                                                   | 125 |
| 3.1.4      | Generalizations and the limits of validity of geometrical optics                                       | 127 |
| 3.2        | General properties of rays                                                                             | 129 |
| 3.2.1      | The differential equation of light rays                                                                | 129 |
| 3.2.2      | The laws of refraction and reflection                                                                  | 132 |
| 3.2.3      | Ray congruences and their focal properties                                                             | 134 |
| 3.3        | Other basic theorems of geometrical optics                                                             | 135 |
| 3.3.1      | Lagrange's integral invariant                                                                          | 135 |
| 3.3.2      | The principle of Fermat                                                                                | 136 |
| 3.3.3      | The theorem of Malus and Dupin and some related theorems                                               | 139 |
| <b>IV</b>  | <b>Geometrical theory of optical imaging</b>                                                           | 142 |
| 4.1        | The characteristic functions of Hamilton                                                               | 142 |
| 4.1.1      | The point characteristic                                                                               | 142 |
| 4.1.2      | The mixed characteristic                                                                               | 144 |
| 4.1.3      | The angle characteristic                                                                               | 146 |
| 4.1.4      | Approximate form of the angle characteristic of a refracting surface of revolution                     | 147 |
| 4.1.5      | Approximate form of the angle characteristic of a reflecting surface of revolution                     | 151 |
| 4.2        | Perfect imaging                                                                                        | 152 |
| 4.2.1      | General theorems                                                                                       | 153 |
| 4.2.2      | Maxwell's 'fish-eye'                                                                                   | 157 |
| 4.2.3      | Stigmatic imaging of surfaces                                                                          | 159 |
| 4.3        | Projective transformation (collimation) with axial symmetry                                            | 160 |
| 4.3.1      | General formulae                                                                                       | 161 |
| 4.3.2      | The telescope case                                                                                     | 164 |
| 4.3.3      | Classification of projective transformations                                                           | 165 |
| 4.3.4      | Combination of projective transformations                                                              | 166 |
| 4.4        | Gaussian optics                                                                                        | 167 |
| 4.4.1      | Refracting surface of revolution                                                                       | 167 |

|           |                                                                                              |     |
|-----------|----------------------------------------------------------------------------------------------|-----|
| 4.4.2     | Reflecting surface of revolution                                                             | 170 |
| 4.4.3     | The thick lens                                                                               | 171 |
| 4.4.4     | The thin lens                                                                                | 174 |
| 4.4.5     | The general centred system                                                                   | 175 |
| 4.5       | Stigmatic imaging with wide-angle pencils                                                    | 178 |
| 4.5.1     | The sine condition                                                                           | 179 |
| 4.5.2     | The Herschel condition                                                                       | 180 |
| 4.6       | Astigmatic pencils of rays                                                                   | 181 |
| 4.6.1     | Focal properties of a thin pencil                                                            | 181 |
| 4.6.2     | Refraction of a thin pencil                                                                  | 182 |
