Preface xxv

1 Elements of probability theory 1

1.1 Definitions 1

1.2 Properties of probabilities 3

1.2.1 Joint probabilities 3
1.2.2 Conditional probabilities 5
1.2.3 Bayes' theorem on inverse probabilities 6

1.3 Random variables and probability distributions 7

1.3.1 Transformations of variates 9
1.3.2 Expectations and moments 11
1.3.3 Chebyshev inequality 15

1.4 Generating functions 16

1.4.1 Moment generating function 16
1.4.2 Characteristic function 17
1.4.3 Cumulants 19

1.5 Some examples of probability distributions 21

1.5.1 Bernoulli or binomial distribution 21
1.5.2 Poisson distribution 23
1.5.3 Bose–Einstein distribution 25
1.5.4 The weak law of large numbers 26
1.5.5 Normal or Gaussian distribution 27
1.5.6 The central limit theorem 30
1.5.7 Gamma distribution 30

1.6 Multivariate Gaussian distribution 33

1.6.1 The Gaussian moment theorem 36
1.6.2 Moment generating function and characteristic function 37
1.6.3 Multiple complex Gaussian variates 38

Problems 39

2 Random (or stochastic) processes 41

2.1 Introduction to statistical ensembles 41

2.1.1 The ensemble average 41
2.1.2 Joint probabilities and correlations 43
2.1.3 The probability functional 44

2.2 Stationarity and ergodicity 45
2.2.1 The time average of a stationary process 47
2.2.2 Ergodicity 48
2.2.3 Examples of random processes 50
2.3 Properties of the autocorrelation function 52
2.4 Spectral properties of a stationary random process 56
2.4.1 Spectral density and the Wiener–Khintchine theorem 56
2.4.2 Singularities of the spectral density 60
2.4.3 Normalized correlations and normalized spectral densities 61
2.4.4 Cross-correlations and cross-spectral densities 62
2.5 Orthogonal representation of a random process 65
2.5.1 The Karhunen–Loéve expansion 66
2.5.2 The limit $T \to \infty$; an alternative approach to the Wiener–Khintchine theorem 68
2.6 Time development and classification of random processes 70
2.6.1 Conditional probability densities 70
2.6.2 Completely random or separable process 71
2.6.3 First-order Markov process 72
2.6.4 Higher-order Markov process 73
2.7 Master equations in integro-differential form 74
2.8 Master equations in differential form 75
2.8.1 The Kramers–Moyal differential equation 76
2.8.2 Vector random process 78
2.8.3 The order of the Kramers–Moyal differential equation 79
2.9 Langevin equation and Fokker–Planck equation 79
2.9.1 Transition moments for the Langevin process 80
2.9.2 Steady-state solution of the Fokker–Planck equation 81
2.9.3 Time-dependent solution of the Fokker–Planck equation 83
2.10 The Wiener process (or one-dimensional random walk) 84
2.10.1 The random walk problem 84
2.10.2 Joint probabilities and autocorrelation 86
2.10.3 Equation of motion of the Wiener process 87
Problems 88

3 Some useful mathematical techniques 92
3.1 The complex analytic signal 92
3.1.1 Definition and basic properties of analytic signals 92
3.1.2 Quasi-monochromatic signals and their envelopes 97
3.1.3 Relationships between correlation functions of real and associated complex analytic random processes 102
3.1.4 Statistical properties of the analytic signal associated with a real Gaussian random process 106
3.2 The angular spectrum representation of wavefields 109
3.2.1 The angular spectrum of a wavefield in a slab geometry 109
3.2.2 The angular spectrum of a wavefield in a half-space 112
3.2.3 An example: diffraction by a semi-transparent object 118
3.2.4 The Weyl representation of a spherical wave 120
3.2.5 The Rayleigh diffraction formulas 125

3.3 The method of stationary phase 128
3.3.1 Definition of an asymptotic expansion 128
3.3.2 Method of stationary phase for single integrals 128
3.3.3 Method of stationary phase for double integrals 133
3.3.4 An example: far-zone behavior of the angular spectrum representation of wavefields 141
Problems 144

4 Second-order coherence theory of scalar wavefields 147
4.1 Introduction 147
4.2 Some elementary concepts and definitions 148
4.2.1 Temporal coherence and the coherence time 148
4.2.2 Spatial coherence and the coherence area 150
4.2.3 Coherence volume and the degeneracy parameter 155
4.3 Interference of two stationary light beams as a second-order correlation phenomenon 159
4.3.1 The laws of interference. The mutual coherence function and the complex degree of coherence 160
4.3.2 Second-order correlations in the space-frequency domain. The cross-spectral density and the spectral degree of coherence 170
4.3.3 Coherence time and bandwidth 176
4.4 Propagation of correlations 180
4.4.1 Differential equations for the propagation of the mutual coherence and of the cross-spectral density in free space 181
4.4.2 Propagation of correlations from a plane 183
4.4.3 Propagation of correlations from finite surfaces 186
4.4.4 The van Cittert–Zernike theorem 188
4.4.5 Propagation of correlations from primary sources 193
4.5 Fields of special types 196
4.5.1 Cross-spectrally pure light 196
4.5.2 Coherent light in the space-time domain 200
4.5.3 Coherent light in the space-frequency domain 205
4.6 Free fields of any state of coherence 207
4.6.1 Sudarshan's equations for the propagation of second-order correlation functions of free fields 208
4.6.2 Time evolution of the second-order correlation functions of free fields 211
4.6.3 A relationship between temporal and spatial coherence properties of free fields 212
4.6.4 A relationship between spectral properties and spatial coherence properties of free fields 213
4.7 Coherent-mode representation and ensemble representation of sources and fields in the space-frequency domain 213
4.7.1 Coherent-mode representation of partially coherent fields in free space 214
4.7.2 Rigorous representation of the cross-spectral density as a correlation function 218
4.7.3 Natural modes of oscillations of partially coherent primary sources and a representation of their cross-spectral density as a correlation function 220

Appendix 4.1 The kernel $H(\mathbf{R})$ of the integral transform representation of the operator $\sqrt{(-\nabla^2)}$ [Eq. (4.6–14)] 223
Appendix 4.2 The Green's function $G(\mathbf{R}, T)$ for the time evolution of the analytic signal representation of free fields and its Fourier transform $\tilde{G}(\mathbf{R}, \nu)$ [Eqs. (4.6–19) and (4.6–34)] 224
Problems 225

5 Radiation from sources of any state of coherence 229
5.1 Introduction 229
5.2 Radiation from three-dimensional primary sources 229
5.2.1 General formulas 229
5.2.2 Radiation from some model sources 233
5.3 Radiation from planar, secondary sources 239
5.3.1 General formulas 239
5.3.2 Radiation from planar, secondary, quasi-homogeneous sources 242
5.3.3 An inverse problem for planar, secondary, quasi-homogeneous sources 245
5.4 Equivalence theorems for planar sources which generate the same radiant intensity 250
5.4.1 An equivalence theorem for planar sources 251
5.4.2 Example: equivalent Gaussian Schell-model sources 252
5.4.3 An experimental test of the equivalence theorem 256
5.5 Coherent-mode representation of Gaussian Schell-model sources 259
5.6 Optical beams 263
5.6.1 Monochromatic beams 263
5.6.2 Example: monochromatic Gaussian beams 267
5.6.3 Partially coherent beams 272
5.6.4 Gaussian Schell-model beams 276
5.7 Foundations of radiometry 287
5.7.1 Energy density, energy flux and the energy conservation law in scalar wavefields 287
5.7.2 Basic concepts of radiometry 292
5.7.3 Radiance function of a planar, secondary, quasi-homogeneous source 297
5.7.4 Radiative energy transfer model 301
5.7.5 Radiometry as a short wavelength limit of statistical wave theory with quasi-homogeneous sources 303
5.8 Effects of spatial coherence of a source on the spectrum of radiated fields 307
5.8.1 Spectrum of the field generated by two partially correlated sources 307
5.8.2 Spectrum of the far field generated by planar, secondary, quasi-homogeneous sources 318
5.8.3 A condition for spectral invariance: the scaling law for planar, secondary, quasi-homogeneous sources 327
Appendix 5.1 Derivation of the asymptotic approximation (5.7–103) 332
Appendix 5.2 Product theorem for Gaussian functions 335
Problems 337

6 Second-order coherence theory of vector electromagnetic fields 340
6.1 Introduction 340
6.2 The 2 × 2 equal-time coherence matrix of a well-collimated, uniform, quasi-monochromatic light beam 342
6.3 Completely unpolarized and completely polarized light. The degree of polarization 350
6.3.1 Unpolarized light (natural light) 350
6.3.2 Completely polarized light 351
6.3.3 The degree of polarization 352
6.4 Transmission of a quasi-monochromatic beam through linear, non-image-forming devices 355
6.4.1 A compensator 357
6.4.2 An absorber 358
6.4.3 A rotator 358
6.4.4 A polarizer 359
6.4.5 A cascaded system 360
6.5 The general second-order coherence matrices and coherence tensors of a stationary electromagnetic field 363
6.5.1 The electric, magnetic and mixed coherence matrices (tensors) 363
6.5.2 First-order differential equations for the propagation of the coherence tensors 365
6.5.3 Wave equations for propagation of the coherence tensors 367
6.6 The second-order cross-spectral density tensors of a stationary electromagnetic field 369
6.6.1 The electric, magnetic and mixed cross-spectral density tensors 369
6.6.2 First-order differential equations for the propagation of the cross-spectral density tensors 372
6.6.3 Helmholtz equations for propagation of the cross-spectral density tensors 372
Problems 373

7 Some applications of second-order coherence theory 375
7.1 Introduction 375
7.2 Stellar interferometry 375
7.3 Interference spectroscopy 381
7.3.1 General principles 381
7.3.2 The phase problem 384
7.4 Coherence of transverse laser resonator modes 389
7.4.1 Steady-state condition for the cross-spectral density of light at a resonator mirror 389
7.4.2 Nature of the solutions of the integral equation (7.4–7) 391
7.5 Dielectric response and the spectrum of induced polarization in a fluctuating medium 396
7.5.1 Medium whose macroscopic properties do not change in time 396
7.5.2 Medium whose macroscopic properties depend on time in a deterministic manner 397
7.5.3 Medium whose macroscopic properties change randomly in time 399

7.6 Scattering from random media 401
7.6.1 Basic equations for deterministic scattering 401
7.6.2 Scattering from deterministic media in the first-order Born approximation 403
7.6.3 Scattering from random media in the first-order Born approximation 406
7.6.4 Some special cases 409
7.6.5 Scattering from a simple fluid 414

Appendix 7.1 Evaluation of the expectation value $\langle\langle \mathcal{P}^*_{1r}(\mathbf{k}, \omega)\mathcal{P}_{1w}(\mathbf{k}', \omega')\rangle\rangle$ [Eq. (7.6–36)] 418
Problems 419

8 Higher-order correlations in optical fields 422
8.1 Introduction 422

8.2 Space-time correlation functions of arbitrary order 422

8.3 Space-frequency correlation functions of arbitrary order 425

8.4 Correlation functions of fields obeying Gaussian statistics 428
8.4.1 Space-time domain 428
8.4.2 Space-frequency domain 432

8.5 Coherent-mode representation of cross-spectral densities of arbitrary order 433
8.5.1 General expressions 433
8.5.2 A single-mode field 435
8.5.3 Fields obeying Gaussian statistics 436

Problems 436

9 Semiclassical theory of photoelectric detection of light 438
9.1 Introduction 438

9.2 Review of elementary quantum mechanics 439

9.3 The differential photodetection probability 441

9.4 Joint probabilities of multiple photodetections 445

9.5 Integral detection probabilities 446

9.6 Photoelectric detection in a fluctuating field 446
9.6.1 Photoelectric bunching 448

9.7 Photoelectric counting statistics of a fluctuating field 449

9.8 Photoelectric current fluctuations 452
9.8.1 Special cases 456
9.8.2 Thermal light 457
9.8.3 Spectral density of the photocurrent 457

9.9 The Hanbury Brown–Twiss effect (semi-classical treatment) 458

9.10 Stellar intensity interferometry 460

9.11 Fluctuation spectroscopy 462

Problems 464

10 Quantization of the free electromagnetic field 465
10.1 Introduction 465
10.2 Classical field Hamiltonian and the canonical equations of motion 466
10.2.1 Plane wave expansions 467
10.2.2 Unit polarization vectors 468
10.2.3 Energy of the electromagnetic field 472
10.3 Canonical quantization of the transverse field 473
10.4 Spectrum of the energy; photons 476
10.4.1 Fock states 478
10.4.2 Approximately localized photons 480
10.4.3 Fock states as a basis 480
10.4.4 The q-representation of the Fock state 482
10.4.5 Time dependence of the field operators 483
10.5 Momentum of the quantized field 484
10.6 Angular momentum of the quantized field 485
10.6.1 Angular momentum as a constant of the motion 486
10.6.2 Decomposition of the total angular momentum 488
10.6.3 Intrinsic (or spin) angular momentum 490
10.6.4 Orbital angular momentum 491
10.7 Phase operators for the quantized field 492
10.7.1 First attempts to construct a phase operator 492
10.7.2 Cosine and sine operators 494
10.7.3 Phase operator based on the phase state projector 495
10.7.4 Operationally defined phase operators 497
10.8 Space-time commutation relations 500
10.8.1 Equations of motion for $\hat{\mathbf{E}}$ and $\hat{\mathbf{B}}$ 503
10.9 Vacuum fluctuations 504
10.9.1 Fluctuations of locally averaged fields 505
10.9.2 Order of magnitude of vacuum fluctuations 507
10.9.3 The Casimir force between conductors 508
10.9.4 The Lamb shift 509
10.9.5 Vacuum effects in the beam splitter 511
10.10 Continuous Fock space 512
10.11 Some theorems on operator algebra 515
10.11.1 The operator expansion theorem 515
10.11.2 Theorems on similarity transformation 517
10.11.3 Derivative theorems 518
10.11.4 Normal and antinormal ordering 518
10.11.5 The Campbell–Baker–Hausdorff theorem 519
Problems 520

11 Coherent states of the electromagnetic field 522
11.1 Introduction 522
11.2 Fock representation of the coherent state 523
11.3 The coherent state as a displaced vacuum state – the displacement operator 525
11.3.1 Properties of the displacement operator 526

11.4 q-representation of the coherent state 528

11.5 Time evolution and uncertainty products 529
11.5.1 Canonical uncertainty product 530
11.5.2 More general states of minimum uncertainty product 531

11.6 Coherent states as a basis; non-orthogonality and over-completeness 533
11.6.1 Linear dependence of coherent states 534
11.6.2 Over-completeness 535
11.6.3 Representation of operators in terms of coherent states 537
11.6.4 Evaluation of matrix elements of operators in normal order 537

11.7 Representation of states and operators by entire functions 538

11.8 Diagonal coherent-state representation of the density operator (Glauber–Sudarshan P-representation) 540
11.8.1 Quasi-probability densities; the Wigner distribution 541
11.8.2 Two virtues of the diagonal representation 542
11.8.3 Diagonal representation of $\hat{\rho}$ by a sequence of functions 543
11.8.4 Diagonal representation of the density operator in anti-normal order 544
11.8.5 Integral representation of $\phi(v)$ 545
11.8.6 Examples of $\phi(v)$ 546

11.9 The optical equivalence theorem for normally ordered operators 555
11.9.1 Quantum characteristic functions 557

11.10 More general phase space representations 558
11.10.1 Introduction 558
11.10.2 Operator ordering 559
11.10.3 Application to quantum expectations and the diagonal coherent-state representation 561

11.11 Multimode fields 562
11.11.1 Coherent states in the continuous mode representation 565

11.12 Positive-frequency and negative-frequency field operators 565
11.12.1 Commutation relations 567
11.12.2 Normally ordered correlations 567

11.13 The field produced by a classical current 568

Problems 570

12 Quantum correlations and photon statistics 573
12.1 Introduction 573

12.2 Photoelectric measurement of the optical field; normal ordering 573
12.2.1 Multiple photodetections; higher-order correlation functions 576
12.2.2 Ordering symbols and ordering operators 578

12.3 Photon density operator 579

12.4 Interference experiments; second-order correlation functions 582

12.5 Correlation functions and cross-spectral densities of arbitrary order 584
12.5.1 Properties of correlation functions 585
12.5.2 Cross-spectral densities of arbitrary order 588
12.5.3 Phase-independent phase space functions 589

12.6 Degree and order of coherence 590

12.7 Implications of second-order coherence 593
12.7.1 Factorization of the correlation functions 593
12.7.2 Correlations of arbitrary order 595
12.7.3 Density operator of the field 596
12.7.4 Wave packets as modes 598

12.8 Stationarity, homogeneity, isotropy 601
12.8.1 Stationarity 601
12.8.2 Condition on the density operator 604
12.8.3 Properties of cross-spectral densities for stationary fields 605
12.8.4 Homogeneity 607
12.8.5 Isotropy 609

12.9 Anti-normally ordered correlations 611
12.9.1 The quantum counter 612
12.9.2 Substitution of differential operators 617
12.9.3 Phase space functional for anti-normally ordered correlations 618

12.10 Photon statistics 622
12.10.1 Probabilities 623
12.10.2 Tests for non-classical states 625
12.10.3 Moments of $\hat{n}$ 626
12.10.4 Generating functions for photon numbers in normal and anti-normal order 627

12.11 The problem of localizing photons 629
12.11.1 Configuration space photon number operator 630
12.11.2 Commutation relations 630
12.11.3 Eigenstates of $\hat{n}(V, t)$ 633
12.11.4 Photon statistics in a finite vol 635
12.11.5 Polychromatic photons and non-locality 635

12.12 Effect of an attenuator or beam splitter on the quantum field 639
12.12.1 Operator relations 640
12.12.2 Photon correlations 641
12.12.3 Michelson interferometer 643
12.12.4 Relationship between input and output states for the beam splitter 644

12.13 Effect of a polarizer on the field 647

12.14 Einstein locality and photon correlations 648
12.14.1 The Einstein–Podolsky–Rosen paradox for an entangled two-photon state 649
12.14.2 Bell's inequality 651
12.14.3 Clauser–Horne form of Bell's inequality 653
12.14.4 Experimental confirmation 655
12.14.5 Non-classical states and Bell inequalities 656

Problems 657

13 Radiation from thermal equilibrium sources 659

13.1 Blackbody radiation 659
13.1.1 The density operator 659
13.1.2 Photon statistics 660
13.1.3 Polarization 663
13.1.4 Spectral distributions 664
13.1.5 The diagonal coherent-state representation of $\hat{\rho}$ 666

13.1.6 Correlation functions of blackbody radiation 667
13.1.7 Higher-order correlations 670
13.1.8 Isotropy of blackbody radiation 671
13.1.9 Intensity fluctuations of blackbody radiation 672

13.2 Thermal light 674

13.3 Stationary, thermal light beams 675
13.3.1 Intensity fluctuations of a thermal light beam 676
13.3.2 Photon statistics with equal average occupation numbers 679

Problems 681

14 Quantum theory of photoelectric detection of light 683
14.1 Interactions of a quantized electromagnetic field 683
14.1.1 Perturbative solution in the interaction picture 684
14.1.2 The electromagnetic interaction between fields and charges 686
14.1.3 Multipolar Hamiltonian 689

14.2 The one-electron photodetection probability 691
14.2.1 Application to the pure coherent state 696
14.2.2 Evaluation of the probability in the quasi-monochromatic approximation 698
14.2.3 Evaluation of the electron matrix element 699
14.2.4 Evaluation of the detection probability for an axially symmetric detector 700

14.3 An N-electron photodetector 702

14.4 The multiple photoelectric detection probability 703

14.5 The multiple detection probability for an arbitrary initial state of the field 704

14.6 Photoelectric correlations 707
14.6.1 The Hanbury Brown–Twiss effect (quantum treatment) 708
14.6.2 Photocurrent correlations 709

14.7 Bunching and antibunching 712
14.7.1 Coincidence detection 713
14.7.2 Two-time pulse correlation measurements 714
14.7.3 Antibunching 719
14.7.4 The time interval distribution of photoelectric pulses 720

14.8 Photoelectric counting statistics 723
14.8.1 The integral detection probability 724
14.8.2 Examples of the detection probability 727
14.8.3 A natural measure of coherence time 733

14.9 Properties of the detection probability $p(n, t, t + T)$ 734
14.9.1 Generating functions and the inversion problem 734
14.9.2 The second moment and sub-Poissonian counting statistics 736
14.9.3 Deriving correlation functions from counting statistics 738

Problems 739

15 Interaction between light and a two-level atom 741
15.1 Dynamical variables for a two-level atom 741
15.1.1 Atomic energy and atomic dipole moment 744

15.2 Bloch-representation of the state 746
15.2.1 Expectation values of spin operators 748
15.3 Interaction of an atom with a classical field 749
15.3.1 Bloch equations 750
15.3.2 Bloch equations in the rotating frame 753
15.3.3 The Rabi problem 754
15.3.4 The response of the atom to a light pulse 756
15.3.5 Hyperbolic secant 2π-pulse 758
15.4 Interaction between an atom and a quantum field – perturbative treatment 761
15.4.1 Absorption and emission of photons 762
15.5 Interaction between an atom and a quantum field – non-perturbative treatment 765
15.5.1 Heisenberg equations of motion 765
15.5.2 Approximate solution – the Einstein A-coefficient and the Lamb shift 769
15.5.3 Integral equations of motion 771
15.5.4 Spontaneous emission 772
15.6 Resonance fluorescence 774
15.6.1 Time development of the light intensity 775
15.6.2 The atomic scattering cross-section 779
15.6.3 Spectrum of the fluorescence 781
15.6.4 Intensity correlation of the fluorescence 785
15.6.5 Measurements of photon antibunching 787
15.6.6 Sub-Poissonian photon statistics 788
15.7 Deflection of atoms by light 790
15.7.1 Momentum transfer after n spontaneous emissions 791
15.7.2 Momentum transfer by stimulated emission or gradient forces in a strong field 795
15.8 Cooling and trapping of atoms 799
15.8.1 Optical molasses 800
15.8.2 An estimate of achievable low temperature based on energy balance 801
Problems 803

16 Collective atomic interactions 805
16.1 Optical free induction decay 805
16.1.1 Experiments 808
16.2 Photon echo 809
16.2.1 Echo experiments 812
16.3 Self-induced transparency 813
16.3.1 Equations of motion of the pulse envelope 814
16.3.2 The area theorem of McCall and Hahn 816
16.3.3 The pulse shape 818
16.3.4 The pulse velocity 822
16.4 Optical bistability 822
16.4.1 Absorptive bistability in a ring cavity 824

16.4.2 Dispersive bistability 830
16.4.3 Chaos in optical bistability 831

16.5 Collective atomic states and collective dynamical variables 832
16.5.1 Dicke states 834
16.5.2 Degeneracy of Dicke states 839

16.6 Cooperative atomic radiation 839
16.6.1 Dicke superradiance 840
16.6.2 Cooperative radiation in an atomic product state 841
16.6.3 Time development of superradiance 843
16.6.4 Some additional complications 847
16.6.5 More general cooperative radiation 848
16.6.6 Superradiant classical oscillations 850

16.7 Atomic coherent states 852
16.7.1 Bloch-representation of the atomic coherent state 854
16.7.2 Non-orthogonality and over-completeness 855
16.7.3 The atomic state produced by a classical field 857

Problems 858

17 Some general techniques for treating interacting systems 860

17.1 The quantum regression theorem 860
17.1.1 Single-time expectation values 862
17.1.2 Multi-time expectation values 862
17.1.3 Spontaneous atomic emission 863
17.1.4 Resonance fluorescence of a two-level atom 864
17.1.5 Quantum regression theorem for normally ordered field operators 866

17.2 The fluctuation–dissipation theorem 867
17.2.1 A simple classical linear dissipative system 867
17.2.2 Quantum mechanical linear dissipative system 870
17.2.3 Power dissipation 871
17.2.4 Current fluctuations in thermal equilibrium 872
17.2.5 Spectral density of the fluctuations 874
17.2.6 Brownian motion of a particle 876
17.2.7 Field fluctuations in blackbody radiation 876

17.3 Master equations 877
17.3.1 The Pauli master equation 878
17.3.2 Zwanzig's generalized master equation 880
17.3.3 Application to the Pauli equation 882
17.3.4 Application to the Dicke problem 883
17.3.5 Linear damping of off-diagonal matrix elements 886

17.4 Quantum noise sources and quantum Langevin equations 887
17.4.1 Introduction 887
17.4.2 Equations of motion of the quantum system 888
17.4.3 Commutation relations 891
17.4.4 Two-time correlation functions 893
17.4.5 Langevin equation for the excitation of the system oscillator 896
17.4.6 Irreversibility and the arrow of time 897

Problems 898

18 The single-mode laser 900
18.1 Introduction 900
18.1.1 Condition for laser action 902
18.2 Semiclassical theory of the laser 903
18.2.1 Normal modes of a cavity 905
18.2.2 Equation of motion of the laser field 908
18.2.3 The phase transition analogy 913
18.3 Semiclassical laser theory with spontaneous emission noise 915
18.3.1 Fokker–Planck equation 916
18.3.2 Steady-state solution 918
18.3.3 The phase transition analogy for a fluctuating laser field 921
18.3.4 Moments of the light intensity 924
18.4 Quantum theory of the laser 929
18.4.1 Master equation of the laser field 931
18.4.2 Photon statistics 936
18.4.3 Steady-state probability 937
18.5 Relationship between quantum and semiclassical laser theories 941
18.5.1 Coherent-state representation of the laser field 941
18.5.2 Steady-state solution of the master equation 945
18.6 Solution of the time-dependent equation of motion 945
18.6.1 Growth of the laser field from the vacuum state 950
18.6.2 Experimental investigations 953
18.7 Correlation functions 954
18.7.1 Green's functions 956
18.7.2 Intensity correlation 956
18.7.3 Field amplitude correlation function and spectral density 959
18.7.4 Higher-order correlations 961
18.8 Laser instabilities and chaos 965
18.8.1 Relationship to the Lorenz model 967
18.8.2 Linear stability analysis 968
18.8.3 Examples of laser instabilities 970
18.8.4 A test for deterministic chaos 972
Problems 974

19 The two-mode ring laser 976
19.1 Equations of motion 977
19.1.1 Inclusion of spontaneous emission fluctuations 980
19.2 The steady-state solution 982
19.2.1 Moments of the light intensity 984
19.2.2 Comparison with experiment 986
19.3 The phase transition analogy 989
19.3.1 Minima of the potential 991
19.3.2 The case coupling constant $\xi < 1$: second-order phase transition 993
19.3.3 The case coupling constant $\xi > 1$: first-order phase transition 994
19.3.4 Latent heat of the phase transition 1000

19.4 Time-dependent solution when mode coupling $\xi = 1$ 1002
19.4.1 Solution by separation of variables when $\xi = 1$, $a_1 = a_2$ 1003
19.4.2 Green's function 1007
19.4.3 Correlation functions 1008
19.5 Time-dependent behavior in the more general case of mode coupling $\xi \neq 1$ 1011
19.5.1 Mode switching and first passage times 1012
19.5.2 First passage time distributions 1018
Problems 1019

20 The linear light amplifier 1021
20.1 Introduction 1021
20.2 Master equation for the amplifier field 1022
20.3 Solution of the master equation 1023
20.3.1 Input–output correlations 1025
20.4 Photon statistics 1025
20.4.1 Probability distributions 1027
20.4.2 The fully inverted light amplifier 1029
20.5 Squeezed light 1030
20.6 Condition for the amplifier output field to be classical 1031
Problems 1032

21 Squeezed states of light 1034
21.1 Definition of quadrature squeezing 1034
21.2 Quantum nature of the squeezed state 1036
21.3 The unitary squeeze operator 1038
21.3.1 Squeezing of the two-photon coherent state 1040
21.3.2 Action of the squeeze operator on any state 1040
21.4 Ideal squeezed states 1042
21.4.1 Photon statistics 1044
21.5 Two-photon coherent states 1046
21.5.1 Transformed Fock states 1047
21.5.2 Coherent-state representation of the two-photon coherent state 1048
21.5.3 Photon statistics of the two-photon coherent state 1049
21.6 Detection of squeezing by homodyning with coherent light 1051
21.7 Squeezing produced in practice: degenerate parametric down-conversion 1053
21.7.1 Production of a squeezed state in degenerate parametric down-conversion 1054
21.8 Broadband squeezed light 1056
21.8.1 Homodyning and correlation functions 1058
21.8.2 Quadrature correlations 1060

21.8.3 Spectral correlations 1061
21.8.4 Spectral component squeezing and degree of squeezing 1063
21.8.5 Examples of the degree of squeezing $Q(\omega)$ 1063

21.9 Higher-order squeezing 1065
21.9.1 Nth-order squeezing of the two-photon coherent state 1066
21.9.2 Amplitude-squared squeezing 1067

Problems 1068

22 Some quantum effects in nonlinear optics 1069
22.1 Introduction 1069

22.2 Energy of the field in a dielectric 1069

22.3 Optical harmonic generation 1070
22.3.1 Squeezing in harmonic generation 1073

22.4 Parametric down-conversion 1074
22.4.1 Solution of the equations of motion 1075
22.4.2 Photon statistics 1076
22.4.3 Proof of non-classical behavior 1078
22.4.4 Multimode perturbative treatment of parametric down-conversion 1079
22.4.5 Entangled quantum state 1082
22.4.6 Rate of down-conversion 1083
22.4.7 Time separation between signal and idler photons 1084
22.4.8 Interference experiments with two down-converters 1088

22.5 Degenerate four-wave mixing 1093
22.5.1 Equations of motion 1095
22.5.2 Application to the coherent state 1096
22.5.3 Squeezing in four-wave mixing 1096
22.5.4 Phase conjugation 1098

22.6 Quantum non-demolition measurements 1100
22.6.1 The Kerr effect – an example of a QND variable 1102
22.6.2 Analysis of an interference experiment 1103
22.6.3 Calculation of fringe visibility 1105
22.6.4 The probe wave phase shift 1105
22.6.5 Complementarity 1106

Problems 1107
