|                                                             |     |
|-------------------------------------------------------------|-----|
| Foreword .....                                              | vii |
| Preface .....                                               | ix  |
| 1. A Review of Basic Mathematical Tools .....               | 1   |
| <i>Lassi Päiväranta</i>                                     |     |
| 1.1 Linear Operators on Hilbert Space .....                 | 1   |
| 1.2 Integral Operators and the Fredholm Alternative .....   | 2   |
| 1.3 The Fourier Transform and the Hilbert Transform .....   | 5   |
| 1.4 The Unique Continuation Principle (UCP) .....           | 7   |
| 1.5 Unbounded Operators .....                               | 7   |
| 1.6 The Spectrum .....                                      | 9   |
| 1.7 The Resolvent Kernel and the Fredholm Determinant ..... | 11  |
| 1.8 A Particle in a Box .....                               | 15  |
| 1.9 Maxwell's Equations .....                               | 18  |
| References .....                                            | 24  |
| 2. Multidimensional Inverse Scattering Theory .....         | 25  |
| <i>David Colton</i>                                         |     |
| 2.1 Electromagnetic Scattering Problem .....                | 25  |
| 2.2 Bessel Functions .....                                  | 28  |
| 2.3 The Addition Formula .....                              | 30  |
| 2.4 Green's Formula .....                                   | 32  |
| 2.5 Basic Properties of Far Field Patterns .....            | 37  |
| 2.6 Spectral Theory of the Far Field Operator .....         | 41  |
| 2.7 The Inverse Scattering Problem .....                    | 45  |
| 2.8 The Detection and Monitoring of Leukemia .....          | 54  |
| 2.9 Regularization .....                                    | 62  |
| 2.10 Closing Remarks .....                                  | 65  |

|                                                                                    |     |
|------------------------------------------------------------------------------------|-----|
| References .....                                                                   | 66  |
| 3. Inverse Sturm–Liouville Problems .....                                          | 67  |
| <i>William Rundell</i>                                                             |     |
| 3.0 Introduction .....                                                             | 67  |
| 3.1 Preliminary Material .....                                                     | 70  |
| 3.2 The Liouville Transformation .....                                             | 76  |
| 3.3 Asymptotic Expansions of the Eigenvalues and Eigenfunctions ..                 | 77  |
| 3.4 The Inverse Problem—A Historical Look .....                                    | 83  |
| 3.5 A Completeness Result .....                                                    | 85  |
| 3.6 An Important Integral Operator .....                                           | 86  |
| 3.7 Solving Hyperbolic Equations .....                                             | 90  |
| 3.8 Uniqueness Proofs .....                                                        | 91  |
| 3.9 Constructive Algorithms .....                                                  | 94  |
| 3.10 Modification for Other Spectral Data .....                                    | 102 |
| 3.11 Other Differential Equations .....                                            | 108 |
| 3.12 Other Constructive Algorithms .....                                           | 113 |
| 3.13 The Matrix Analogue .....                                                     | 114 |
| 3.14 Another Finite-Dimensional Algorithm .....                                    | 117 |
| 3.15 Fourth-Order Problems .....                                                   | 123 |
| References .....                                                                   | 125 |
| 4. Inverse Problems in Potential Scattering .....                                  | 131 |
| <i>Khosrow Chadan</i>                                                              |     |
| 4.1 Introduction .....                                                             | 131 |
| 4.2 Physical Background and Formulation of the Inverse Scattering<br>Problem ..... | 131 |
| 4.3 Scattering Theory for Partial Waves .....                                      | 137 |
| 4.4 Gel'fand–Levitan Integral Equation .....                                       | 164 |
| 4.5 Marchenko Equation .....                                                       | 174 |
| 4.6 Inverse Problem on the Line .....                                              | 178 |
| 4.7 Nonlinear Evolution Equations .....                                            | 186 |
| 4.8 Closing Remarks .....                                                          | 190 |
| A Appendix .....                                                                   | 190 |
| References .....                                                                   | 191 |
| Index .....                                                                        | 195 |
