Contents

Preface	vii
0 Introduction and other preliminaries	1
1 Prerequisites and philosophy	1
2 Notation and basic geometry	2
3 Exercises	6
1 The Moore-Penrose or generalized inverse	8
1 Basic definitions	8
2 Basic properties of the generalized inverse	10
3 Computation of A^+	12
4 Generalized inverse of a product	19
5 Exercises	25
2 Least squares solutions	28
1 What kind of answer is A^+b ?	28
2 Fitting a linear hypothesis	30
3 Estimating the unknown parameters	32
4 Goodness of fit	34
5 An application to curve fitting	39
6 Polynomial and more general fittings	42
7 Why A^+ ?	45
3 Sums, partitioned matrices and the constrained generalized inverse	46
1 The generalized inverse of a sum	46
2 Modified matrices	51
3 Partitioned matrices	53
4 Block triangular matrices	61
5 The fundamental matrix of constrained minimization	63
6 Constrained least squares and constrained generalized inverses	65
7 Exercises	69

4	Partial isometries and EP matrices	71
1	Introduction	71
2	Partial isometries	71
3	EP matrices	74
4	Exercises	75
5	The generalized inverse in electrical engineering	77
1	Introduction	77
2	n -port networks and the impedance matrix	77
3	Parallel sums	82
4	Shorted matrices	86
5	Other uses of the generalized inverse	88
6	Exercises	88
7	References and further reading	89
6	(i, j, k)-Generalized inverses and linear estimation	91
1	Introduction	91
2	Definitions	91
3	(I)-inverses	96
4	Applications to the theory of linear estimation	104
5	Exercises	115
7	The Drazin inverse	120
1	Introduction	120
2	Definitions	121
3	Basic properties of the Drazin inverse	127
4	Spectral properties of the Drazin inverse	129
5	A^D as a polynomial in A	130
6	A^D as a limit	136
7	The Drazin inverse of a partitioned matrix	139
8	Other properties	147
8	Applications of the Drazin inverse to the theory of finite Markov chains	151
1	Introduction and terminology	151
2	Introduction of the Drazin inverse into the theory of finite Markov chains	152
3	Regular chains	157
4	Ergodic chains	158
5	Calculation of A^k and w^* for an ergodic chain	160
6	Non-ergodic chains and absorbing chains	165
7	References and further reading	170
9	Applications of the Drazin inverse	171
1	Introduction	171
2	Applications of the Drazin inverse to linear systems of differential equations	171

3	Applications of the Drazin inverse to difference equations	181
4	The Leslie population growth model and backward population projection	184
5	Optimal control	187
6	Functions of a matrix	200
7	Weak Drazin inverses	202
8	Exercises	208
10	Continuity of the generalized inverse	210
1	Introduction	210
2	Matrix norms	210
3	Matrix norms and invertibility	214
4	Continuity of the Moore–Penrose generalized inverse	216
5	Matrix valued functions	224
6	Non-linear least squares problems: an example	229
7	Other inverses	231
8	Exercises	234
9	References and further reading	235
11	Linear programming	236
1	Introduction and basic theory	236
2	Pyle's reformulation	241
3	Exercises	244
4	References and further reading	245
12	Computational concerns	246
1	Introduction	246
2	Calculation of A^+	247
3	Computation of the singular value decomposition	251
4	(1)-inverses	255
5	Computation of the Drazin inverse	255
6	Previous algorithms	260
7	Exercises	261
	Bibliography	263
	Index	269
