

Nonlinear ordinary differential equations

An introduction to dynamical systems

THIRD EDITION

D.W. Jordan and P. Smith
Keele University

OXFORD
UNIVERSITY PRESS

Contents

I Second-order differential equations in the phase plane

- 1.1 Phase diagram for the pendulum equation 7
- 1.2 Autonomous equations in the phase plane 5
- 1.3 Mechanical analogy for the conservative system $\ddot{x} = f(x)$ 14
- 1.4 The damped linear oscillator 22
- 1.5 Nonlinear damping; limit cycles 26
- 1.6 Some applications 33
- 1.7 Parameter-dependent conservative systems 39
- 1.8 Graphical representation of solutions 42
- Problems 43

2 Plane autonomous systems and linearization

- 2.1 The general phase plane 51
- 2.2 Some population models 55
- 2.3 Linear approximation at equilibrium points 59
- 2.4 The general solution of linear autonomous plane systems 60
- 2.5 The phase paths of linear autonomous plane systems 66
- 2.6 Scaling in the phase diagram for a linear autonomous system 75
- 2.7 Constructing a phase diagram 76
- 2.8 Hamiltonian systems 78
- Problems 82

3 Geometrical aspects of plane autonomous systems

- 3.1 The index of a point 92
- 3.2 The index at infinity 100
- 3.3 The phase diagram at infinity 103
- 3.4 Limit cycles and other closed paths 108
- 3.5 Computation of the phase diagram 111
- 3.6 Homoclinic and heteroclinic paths 114
- Problems 117

4 Periodic solutions; averaging methods

- 4.1 An energy-balance method for limit cycles 131
- 4.2 Amplitude and frequency estimates: polar coordinates 136

- 4.3 An averaging method for spiral phase paths 141
- 4.4 Periodic solutions; harmonic balance 144
- 4.5 The equivalent linear equation by harmonic balance 146
- Problems 149

5 Perturbation methods

- 5.1 Nonautonomous systems: forced oscillations 156
- 5.2 Outline of the direct method for the undamped case; Duffing's equation 160
- 5.3 Forced oscillations far from resonance 162
- 5.4 Forced oscillations near resonance with weak excitation 164
- 5.5 The amplitude equation for the undamped pendulum 167
- 5.6 The amplitude equation for a damped pendulum 170
- 5.7 Soft and hard springs 171
- 5.8 Amplitude-phase perturbation for the pendulum equation 174
- 5.9 Periodic solutions of autonomous equations (Lindstedt's method) 176
- 5.10 Forced oscillation of a self-excited equation 178
- 5.11 The perturbation method and Fourier series 181
- 5.12 Homoclinic bifurcation: an example 183
- Problems 186

6 Singular perturbation methods

- 6.1 Non-uniform approximations to functions on an interval 191
- 6.2 Coordinate perturbation 193
- 6.3 Lighthill's method 199
- 6.4 Time-scaling for series solutions of autonomous equations 201
- 6.5 The multiple-scale technique applied to saddle points and nodes 208
- 6.6 Matching approximations on an interval 217
- 6.7 A matching technique for differential equations 222
- Problems 229

7 Forced oscillations: harmonic and subharmonic response, stability, and entrainment

- 7.1 General forced periodic solutions 237
- 7.2 Harmonic solutions, transients, and stability for Duffing's equation 239
- 7.3 The jump phenomenon 245
- 7.4 Harmonic oscillations, stability, and transients for the forced van der Pol equation 248
- 7.5 Frequency entrainment for the van der Pol equation 253
- 7.6 Subharmonics of Duffing's equation by perturbation 257
- 7.7 Stability and transients for subharmonics of Duffing's equation 262
- Problems 266

8 Stability

- 8.1 Poincaré stability (stability of paths) 277
- 8.2 Paths and solution curves for general systems 282

- 8.3 Stability of time solutions: Liapunov stability 284
- 8.4 Liapunov stability of plane autonomous linear systems 289
- 8.5 Structure of the solutions of n -dimensional linear systems 292
- 8.6 Structure of n -dimensional inhomogeneous linear systems 297
- 8.7 Stability and boundedness for linear systems 300
- 8.8 Stability of linear systems with constant coefficients 303
- 8.9 Linear approximation at equilibrium points for first-order systems in n variables 306
- 8.10 Stability of a class of nonautonomous linear systems in n dimensions 309
- 8.11 Stability of the zero solutions of nearly linear systems 315
- Problems 317

9 Determination of stability by solution perturbation

- 9.1 The stability of forced oscillations by solution perturbation 322
- 9.2 Equations with periodic coefficients (Floquet theory) 325
- 9.3 Mathieu's equation arising from a Duffing equation 332
- 9.4 Transition curves for Mathieu's equation by perturbation 336
- 9.5 Mathieu's damped equation arising from a Duffing equation 338
- Problems 341

10 Liapunov methods for determining stability of the zero solution

- 10.1 Introducing the Liapunov method 348
- 10.2 Topographic systems and the Poincaré-Bendixson theorem 349
- 10.3 Liapunov stability of the zero solution 353
- 10.4 Asymptotic stability of the zero solution 357
- 10.5 Extending weak Liapunov functions to asymptotic stability 360
- 10.6 A more general theory for autonomous systems 363
- 10.7 A test for instability of the zero solution: n dimensions 367
- 10.8 Stability and the linear approximation in two dimensions 369
- 10.9 Exponential function of a matrix 376
- 10.10 Stability and the linear approximation for n th order autonomous systems 378
- 10.11 Special systems 384
- Problems 388

11 The existence of periodic solutions

- 11.1 The Poincaré-Bendixson theorem and periodic solutions 397
- 11.2 A theorem on the existence of a centre 404
- 11.3 A theorem on the existence of a limit cycle 408
- 11.4 Van der Pol's equation with large parameter 414
- Problems 417

12 Bifurcations and manifolds

- 12.1 Examples of simple bifurcations 420
- 12.2 The fold and the cusp 422
- 12.3 Structural stability 426
- 12.4 Further types of bifurcation 429
- 12.5 Hopf bifurcations 437
- 12.6 Higher-order systems: manifolds 439
- 12.7 Linear approximation: centre manifolds 445
- Problems 452

13 Poincaré sequences, homoclinic bifurcation, and chaos

- 13.1 Poincaré sequences 457
- 13.2 Homoclinic paths, strange attractors and chaos 467
- 13.3 The Duffing oscillator 471
- 13.4 The logistic difference equation 480
- 13.5 Homoclinic bifurcation for forced systems 484
- 13.6 The horseshoe map 492
- 13.7 Melnikov's method for detecting homoclinic bifurcation 493
- 13.8 Power spectra 499
- 13.9 Some characteristic features of chaotic oscillations 500
- Problems 502

Hints and answers to the problems 517**Appendices**

- A Existence and uniqueness theorems 530
- B Topographic systems 532
- C Norms for vectors and matrices 535
- D A contour integral 536

References and further reading 539**Index 542**
