CONTENTS

<i>List of symbols</i>	xv
1 Aspects of parallel computing	1
1.1 Parallel architectures	2
1.2 Specific computers	5
1.3 Techniques of parallelization	9
1.4 Communication and computation	12
1.5 Parallel languages	15
1.6 Parallel scientific libraries	18
1.7 Heterogeneous and distributed computing	20
1.8 Parallel software tools	22
1.9 Performance measures	24
2 An introduction to sequential ODE methods	28
2.1 The initial value problem	29
2.2 Stiffness	32
2.3 The occurrence of stiffness	35
2.4 Two elementary numerical methods	38
2.5 A general framework for IVP methods	41
2.6 Linear multistep methods	41
2.7 Runge-Kutta methods	45
2.8 Multivalued methods	50
2.9 Other approaches	55
2.10 Additional features of IVPs	59
3 Order and stability – a general framework	62
3.1 Zero stability, linear stability and convergence	63
3.2 Order	67
3.3 Linear stability	80

3.4	Explicit methods	88
3.5	Implicit methods	93
3.6	Nonlinear stability	103
3.7	Stiff order and differential-algebraic equations	106
3.8	Variable-stepsize implementations	111
4	Parallel linear algebra	115
4.1	Approaches to parallel programming	116
4.2	Cyclic reduction	117
4.3	Partitioning	120
4.4	Direct methods	121
4.5	Stationary iterative techniques	127
4.6	Multigrid techniques	132
4.7	Deflation techniques for systems of equations	136
4.8	Krylov subspace techniques	145
4.9	Aspects of parallelization	155
5	Direct methods for ODES	165
5.1	Introduction	166
5.2	Direct methods	170
5.3	Multiply implicit methods	175
5.4	Prediction-correction: a background	184
5.5	A general framework	187
5.6	Parallel one-block methods	194
5.7	Limits on parallelism	198
5.8	An error analysis	201
5.9	High order predictors	210
5.10	Diagonally implicit iteration	219
5.11	Prediction-correction based on general splittings	225
6	Diverse approaches to parallelism	231
6.1	Linear IVPs	232
6.2	Linear BVPs	233
6.3	The Krylov subspace techniques	238

6.4	Extrapolation	242
6.5	Using parallelism for robustness	245
6.6	Other techniques	246
6.7	Parallelism across the steps	252
6.8	Delay differential equations	264
6.9	Applications to other differential systems	268
7	Waveform relaxation techniques	276
7.1	The Picard method	278
7.2	Jacobi and Gauss-Seidel WR algorithms	281
7.3	Multisplitting WR algorithms	284
7.4	The convergence of linear WR algorithms	286
7.5	Some convergence results	292
7.6	Linear acceleration of waveform iteration	296
7.7	The convergence of overlapping splittings	299
7.8	Multigrid waveform techniques	302
7.9	Nonlinear convergence	311
7.10	Waveform Newton iteration	317
7.11	Asynchronous techniques	320
7.12	Other applications	321
7.13	Preconditioning	327
8	Discrete waveform methods	336
8.1	An example	337
8.2	Linear multistep WR methods	341
8.3	Runge-Kutta WR methods	346
8.4	Discretized multisplittings	352
8.5	Mesh refinement and the nonlinear problem	353
8.6	Multistage methods in waveform relaxation	361
8.7	Contractivity of waveform RK methods	366
9	Implementation of waveform algorithms	373
9.1	Coupling and reordering	374
9.2	Adaptive waveform algorithms	380

9.3	VODE, VODEPK, DASPK - ODE solvers	385
9.4	A case study	389
9.5	Numerical results	396
9.6	Conclusions	400
