

Foundations of Mathematical Analysis

J. K. TRUSS

*Reader in Pure Mathematics
University of Leeds*

CLARENDON PRESS • OXFORD

1997

CONTENTS

1	The natural numbers	1
1.1	The Frege–Russell definition of the natural numbers	1
1.2	Peano's axioms	7
1.3	A formal system for arithmetic	12
1.4	Coding and Gödel's theorems	16
2	Some set theory	22
2.1	Ordinal numbers	22
2.2	$\mathbb{N}$ as the set of finite ordinals	28
2.3	Non-standard models of arithmetic	30
2.4	Partially ordered sets and Zorn's lemma	32
2.5	Introduction to cardinals	34
3	The integers	38
3.1	The existence and uniqueness of $\mathbb{Z}$	38
3.2	A natural construction of $\mathbb{Z}$	45
3.3	A construction of $\mathbb{Z}$ by redefining $+$	47
3.4	$\mathbb{Z}$ as an ordered ring	49
3.5	Euclidean domains and factorization	53
3.6	Ideals	58
4	The rational numbers	64
4.1	The field of fractions of an integral domain	64
4.2	Decimal representation of rationals	71
4.3	Basic linear algebra and introduction to fields	79
4.4	The field of rational functions and analogies with $\mathbb{Q}$	86
4.5	$\mathbb{Q}$ as an ordered set	92
5	The real numbers	95
5.1	Completions of linearly ordered sets	95
5.2	The arithmetical operations on $\mathbb{R}$	101
5.3	The order topology	105
5.4	Eudoxus' theory of magnitudes	110
5.5	Completeness as a second order axiom	112
5.6	Uncountability of $\mathbb{R}$: the long line	114
5.7	Suslin's problem	117
6	Metric spaces	121
6.1	Definition and examples of metric spaces	121

6.2	Cauchy sequences and completions	126
6.3	Comparison of different constructions of $\mathbb{R}$	132
6.4	p -adic numbers	137
7	Beginnings of analysis	143
7.1	Topology of the real line: the Heine-Borel theorem	143
7.2	Integration	147
7.3	Differentiation	154
7.4	Standard analytic functions	162
8	The complex numbers	172
8.1	The construction of $\mathbb{C}$	172
8.2	General finite field extensions	177
8.3	Group-theoretical preliminaries	181
8.4	Elementary Galois theory	188
8.5	Solution of polynomial equations by radicals	193
8.6	Fundamental theorem of algebra	200
8.7	Other examples of algebraically closed fields	203
9	Irrational numbers	208
9.1	Irrationality of $\sqrt{n}$ for n square-free, $n > 1$	208
9.2	Transcendental numbers: Liouville numbers	211
9.3	Transcendence of e and π	213
9.4	Algebraic independence	219
9.5	Calculation of the values of irrationals	221
10	Classical spaces associated with $\mathbb{R}$	232
10.1	Cantor space and Baire space	232
10.2	Identification of 2^{ω} and ω^{ω} with subspaces of $\mathbb{R}$	235
10.3	Standard topological properties	246
10.4	Abstract characterizations	253
11	Measure and category	258
11.1	The Baire category theorem	258
11.2	Lebesgue measure	262
11.3	The Lebesgue integral	269
11.4	The existence of non-measurable sets	275
11.5	Analogies between measure and category	279
12	The continuum hypothesis	288
12.1	The Cantor-Bendixson theorem	288
12.2	The beginnings of descriptive set theory	291
12.3	Suslin's operation	293
12.4	Gödel's and Cohen's results	298

13 Constructive analysis	308
13.1 The intuitionistic view of mathematical objects	308
13.2 The development of constructive analysis	313
13.3 The topological interpretation	320
13.4 Analysis and the axiom of choice	326
