

General Theory of Functions and Integration

ANGUS E. TAYLOR

University of California, Berkeley and Los Angeles

DOVER PUBLICATIONS, INC.
NEW YORK

Contents

1. The Real Numbers, Point Sets and Sequences

1-0	Introduction	1
1-1	The real line	2
1-2	Notation and terminology concerning sets	7
1-3	Construction of a complete ordered field	12
1-4	Archimedean order, Countability of the rationals	16
1-5	Point sets, Upper and lower bounds	21
1-6	Real sequences	24
1-7	The extended real number system	29
1-8	Cauchy's convergence condition	32
1-9	The theorem on nested intervals	34

2. Euclidean Space, Topology and Continuous Functions

2-0	Introduction	37
2-1	The space R^n	38
2-2	Linear configurations in R^n	43
2-3	The topology of R^n	47
2-4	Nests, points of accumulation, and convergent sequences	56
2-5	Covering theorems	61
2-6	Compactness	65
2-7	Functions, Continuity	68
2-8	Connected sets	76
2-9	Relative topologies	83
2-10	Cantor's ternary set	86

3. Abstract Spaces	
3-0 Introduction	89
3-1 Topological spaces	90
3-2 Compactness and other properties	96
3-3 Postulates of separation	102
3-4 Postulated neighborhood systems	105
3-5 Compactification. Local compactness	107
3-6 Metric spaces	111
3-7 Compactness in metric spaces	121
3-8 Completeness and completion	124
3-9 Category	127
3-10 Zorn's lemma	131
3-11 Cartesian product topologies	134
3-12 Vector spaces	140
3-13 Normed linear spaces	144
3-14 Hilbert spaces	153
3-15 Spaces of continuous functions	164
4. The Theory of Measure	
4-0 Introduction	177
4-1 Algebraic operations in R^*	178
4-2 Rings and σ -Rings	180
4-3 Additive set functions	185
4-4 Some properties of measures	188
4-5 Preliminary remarks about Lebesgue measure	189
4-6 Lebesgue outer measure in R^n	191
4-7 The measure induced by an outer measure	196
4-8 Lebesgue measure in R^k	203
4-9 A general method of constructing outer measures	215
4-10 Outer measures in R from monotone functions	218
4-11 The completion of a measure	224
5. The Lebesgue Integral	
5-0 Introduction	226
5-1 Measurable functions	229
5-2 The integral of a bounded function	240

5-3	Preliminary convergence theorems	248
5-4	The general definition of an integral	252
5-5	Some basic convergence theorems	260
5-6	Convergence in measure	265
5-7	Convergence in mean	270
5-8	The L^p spaces	274
5-9	Integration with respect to the completion of a measure	278
6. Integration by the Daniell Method		
6-0	Introduction	281
6-1	Elementary integrals on a vector lattice of functions	282
6-2	Over-functions and under-functions	284
6-3	Summable functions	288
6-4	Sets of measure zero	292
6-5	Measurable functions and measurable sets	297
6-6	The N-norm	300
6-7	Connections with Chapter 5	303
6-8	Induction of Lebesgue measure in R^k	310
6-9	Arbitrary elementary integrals on $C_n(R^k)$	313
6-10	Regular Borel measures in R^k	319
6-11	The class $\mathcal{L}^p$	321
7. Iterated Integrals and Fubini's Theorem		
7-0	Introduction	324
7-1	The Fubini theorem for Euclidean spaces	326
7-2	The Fubini-Stone theorem	329
7-3	Products of functions of one variable	334
7-4	Iterated integrals and products of Euclidean spaces	336
7-5	Abstract theory of product-measures	339
7-6	The abstract Fubini theorem	345
8. The Theory of Signed Measures		
8-0	Introduction	348
8-1	Signed measures	349
8-2	Absolute continuity	356

8-3	The Radon-Nikodym theorem	358
8-4	Continuous linear functionals on $L^p(\mu)$	361
8-5	The Lebesgue decomposition of a signed measure	364
8-6	Alternative approach via elementary integrals	366
8-7	The decomposition of linear functionals	371
9.	Functions of One Real Variable	
9-0	Introduction	379
9-1	Monotone functions	379
9-2	Vector-valued functions of bounded variation	382
9-3	Rectifiable curves	388
9-4	Real-valued functions of bounded variation	390
9-5	Stieltjes integrals	392
9-6	Convergence theorems for functions of bounded variation	398
9-7	Differentiation of monotone functions	402
9-8	Absolutely continuous functions	410
