

THE DIFFERENTIAL INVARIANTS OF GENERALIZED SPACES

BY

TRACY YERKES THOMAS

ASSOCIATE PROFESSOR OF MATHEMATICS
IN PRINCETON UNIVERSITY

CHELSEA PUBLISHING COMPANY
NEW YORK, N. Y.

CONTENTS

CHAPTER I

N-DIMENSIONAL SPACES

SECTION	PAGE
1. Space. Coordinates	1
2. Affine connection	4
3. Affine geometry of paths	6
4. Projective geometry of paths	9
5. Riemann or metric space	10
6. Space of distant parallelism	15
7. Conformal space	20
8. Weyl space. Gauge	22
9. Transformation theory of space	25

CHAPTER II

AFFINE AND RELATED INVARIANTS

10. Tensors	30
11. Invariants	35
12. Parallel displacement of a vector around an infinitesimal closed circuit	38
13. Covariant differentiation	42
14. Alternative methods of covariant differentiation. Extension	47
15. Differential parameters	49

CHAPTER III

PROJECTIVE INVARIANTS

16. Affine representation of projective spaces	53
17. Some geometrical interpretations	56
18. Projective tensors and invariants	57
19. Transformations of the group $\star\mathfrak{P}$	59

CHAPTER IV

CONFORMAL INVARIANTS

20. Fundamental conformal-affine tensor	66
21. Affine representation of conformal spaces	67
22. Conformal tensors and invariants	71
23. Completion of the incomplete covariant derivative. General case	74
24. An extension of the preceding method	76
25. Systems algebraically equivalent to the system of equations of transformation of the components of a conformal tensor	78
26. Exceptional case $K=0$	80
27. Exceptional case $L=0$	81
28. The complete conformal curvature tensor and its successive covariant derivatives	81

CHAPTER V

NORMAL COORDINATES

SECTION	PAGE
29. Affine normal coordinates	84
30. Absolute normal coordinates	87
31. Projective normal coordinates	91
32. General theory of extension	96
33. Some formulae of extension	98
34. Scalar differentiation in a space of distant parallelism	100
35. Differential invariants defined by means of normal coordinates. Normal tensors	102
36. A generalization of the affine normal tensors	105
37. Formulae of repeated extension	107
38. A theorem on the affine connection	108
39. Replacement theorems	109

CHAPTER VI

SPATIAL IDENTITIES

40. Complete sets of identities	112
41. Identities in the components of the normal tensors	112
42. Identities of the space of distant parallelism	115
43. Determination of the components of the normal tensors in terms of the components of their extensions	116
44. Generalization of the preceding identities	120
45. Space determination by tensor invariants	122
46. Relations between the components of the extensions of the normal tensors	123
47. Convergence proofs	126
48. Relations between the components of certain invariants of the space of distant parallelism	129
49. Determination of the components of the affine normal tensors in terms of the components of the curvature tensor and its covariant derivatives	130
50. Curvature. Theorem of Schur	132
51. Identities in the components of the projective curvature tensor	136
52. Certain divergence identities	138
53. A general method for obtaining divergence identities	140
54. Numbers of algebraically independent components of certain spatial invariants	143

CHAPTER VII

ABSOLUTE SCALAR DIFFERENTIAL
INVARIANTS AND PARAMETERS

55. Abstract groups	149
56. Finite continuous groups	150
57. Essential parameters	152
58. The parameter groups	153
59. Fundamental differential equations of an r -parameter group	154
60. Transformation theory connected with the fundamental differential equations	156

SECTION	PAGE
01. Equivalent r -parameter groups	157
02. Constants of composition	159
03. Group space and its structure	160
04. Infinitesimal transformations	161
05. Transitive and intransitive groups. Invariant sub-spaces	163
06. Invariant functions	164
07. Groups defined by the equations of transformation of the components of tensors	165
08. Infinitesimal transformations of the affine and metric groups	166
09. Differential equations of absolute affine and metric scalar differential invariants	168
70. Absolute metric differential invariants of order zero	168
71. General theorems on the independence of the differential equations	169
72. Number of independent differential equations. Affine case	175
73. Number of independent differential equations. Metric case	177
74. Exceptional case of two dimensions	179
75. Fundamental sets of absolute scalar differential invariants	182
76. Rational invariants	184
77. Absolute scalar differential parameters	185
78. Independence of the differential equations of the differential parameters	186
79. Fundamental sets of differential parameters	192
90. Extension to relative tensor differential invariants	193

CHAPTER VIII

THE EQUIVALENCE PROBLEM

81. Equivalence of generalized spaces	197
82. Normal coordinates and the equivalence problem	200
83. Complete sets of invariants	202
84. A theorem on mixed systems of partial differential equations	202
85. Finite equivalence theorem for affinely connected spaces	204
86. Finite equivalence theorem for metric spaces	206
87. Finite equivalence theorem for spaces of distant parallelism	207
88. Finite equivalence theorem for projective spaces	208
89. Equivalence of two dimensional conformal spaces	208
90. Finite equivalence theorem for conformal spaces of three or more dimensions	211
91. Spatial arithmetic invariants	212

CHAPTER IX

REDUCIBILITY OF SPACES

92. Differential conditions of reducibility	215
93. Flat spaces	216
94. Reducibility of the general affinely connected space to a space of distant parallelism	218
95. Algebraic conditions for the reducibility of the affine space of paths to a metric space	218
96. Algebraic conditions for the reducibility of the affine space of paths to a Weyl space	219

CHAPTER X

FUNCTIONAL ARBITRARINESS OF SPATIAL INVARIANTS

SECTION	PAGE
97. Regular systems of partial differential equations	221
98. Extension to tensor differential equations	224
99. General existence theorem for regular systems	226
100. Groups of independent components	226
101. Special case of two dimensions	228
102. General case of $n (\geq 3)$ dimensions	229
103. The existence theorems in normal coordinates	233
104. Convergence of the A series	236
105. Convergence of the g series	239
INDEX	241
