

M. Abate   J. E. Fornaess   X. Huang  
J.-P. Rosay   A. Tumanov

# Real Methods in Complex and CR Geometry

Lectures given at the  
C.I.M.E. Summer School  
held in Martina Franca, Italy,  
June 30 – July 6, 2002

Editors: D. Zaitsev  
G. Zampieri

Fondazione  
C.I.M.E.

 Springer

## Contents

### Angular Derivatives in Several Complex Variables

|                                             |    |
|---------------------------------------------|----|
| <i>Mauro Abate</i> .....                    | 1  |
| 1 Introduction .....                        | 1  |
| 2 One Complex Variable .....                | 4  |
| 1 Julia's Lemma .....                       | 12 |
| 1 Lindelöf Principles .....                 | 21 |
| 1 The Julia-Wolf-Carathéodory Theorem ..... | 32 |
| References .....                            | 45 |

### Real Methods in Complex Dynamics

|                                                                     |     |
|---------------------------------------------------------------------|-----|
| <i>John Erik Fornæss</i> .....                                      | 49  |
| 1 Lecture 1: Introduction to Complex Dynamics and Its Methods ..... | 49  |
| 1.1 Introduction .....                                              | 49  |
| 1.2 General Remarks on Dynamics .....                               | 53  |
| 1.3 An Introduction to Complex Dynamics and Its Methods .....       | 56  |
| 2 Lecture 2: Basic Complex Dynamics in Higher Dimension .....       | 62  |
| 2.1 Local Dynamics .....                                            | 62  |
| 2.2 Global Dynamics .....                                           | 71  |
| 2.3 Fatou Components .....                                          | 74  |
| 3 Lecture 3: Saddle Points for Hénon Maps .....                     | 77  |
| 3.1 Elementary Properties of Hénon Maps .....                       | 78  |
| 3.2 Ergodicity and Measure Hyperbolicity .....                      | 79  |
| 3.3 Density of Saddle Points .....                                  | 83  |
| 4 Lecture 4: Saddle Hyperbolicity for Hénon Maps .....              | 87  |
| 4.1 $J$ and $J^*$ .....                                             | 87  |
| 4.2 Proof of Theorem 4.10 .....                                     | 91  |
| 4.3 Proof of Theorem 4.9 .....                                      | 96  |
| References .....                                                    | 105 |

## Local Equivalence Problems for Real Submanifolds in Complex Spaces

|                                                                                                            |     |
|------------------------------------------------------------------------------------------------------------|-----|
| <i>Xiaojun Huang</i> .....                                                                                 | 109 |
| 1 Global and Local Equivalence Problems .....                                                              | 109 |
| 2 Formal Theory for Levi Non-degenerate Real Hypersurfaces .....                                           | 113 |
| 2.1 General Theory for Formal Hypersurfaces .....                                                          | 113 |
| 2.2 $\mathcal{H}_k$ -Space and Hypersurfaces in the $\mathcal{H}_k$ -Normal Form .....                     | 119 |
| 2.3 Application to the Rigidity and Non-embeddability Problems ...                                         | 124 |
| 2.4 Chern-Moser Normal Space $\mathcal{N}_{CH}$ .....                                                      | 128 |
| 3 Bishop Surfaces with Vanishing Bishop Invariants .....                                                   | 129 |
| 3.1 Formal Theory for Bishop Surfaces<br>with Vanishing Bishop Invariant .....                             | 131 |
| 4 Moser-Webster's Theory on Bishop Surfaces<br>with Non-exceptional Bishop Invariants .....                | 140 |
| 4.1 Complexification $\mathcal{M}$ of $M$ and a Pair<br>of Involutions Associated with $\mathcal{M}$ ..... | 141 |
| 4.2 Linear Theory of a Pair of Involutions Intertwined<br>by a Conjugate Holomorphic Involution .....      | 142 |
| 4.3 General Theory on the Involutions<br>and the Moser-Webster Normal Form .....                           | 144 |
| 5 Geometric Method to the Study of Local Equivalence Problems .....                                        | 147 |
| 5.1 Cartan's Theory on the Equivalent Problem .....                                                        | 147 |
| 5.2 Segre Family of Real Analytic Hypersurfaces .....                                                      | 153 |
| 5.3 Cartan-Chern-Moser Theory for Germs<br>of Strongly Pseudoconvex Hypersurfaces .....                    | 159 |
| References .....                                                                                           | 161 |

## Introduction to a General Theory of Boundary Values

|                                                                                                                                                                           |     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <i>Jean-Pierre Rosay</i> .....                                                                                                                                            | 165 |
| 1 Introduction - Basic Definitions .....                                                                                                                                  | 167 |
| 1.1 What Should a General Notion of Boundary Value Be? .....                                                                                                              | 167 |
| 1.2 Definition of Strong Boundary Value (Global Case) .....                                                                                                               | 167 |
| 1.3 Remarks on Smooth (Not Real Analytic) Boundaries .....                                                                                                                | 168 |
| 1.4 Analytic Functionals .....                                                                                                                                            | 168 |
| 1.5 Analytic Functional as Boundary Values .....                                                                                                                          | 168 |
| 1.6 Some Basic Properties of Analytic Functionals .....                                                                                                                   | 169 |
| Carriers - Martineau's Theorem .....                                                                                                                                      | 169 |
| Local Analytic Functionals .....                                                                                                                                          | 170 |
| 1.7 Hyperfunctions .....                                                                                                                                                  | 170 |
| The Notion of Functional (Analytic Functional or Distribution,<br>etc.) Carried by a Set, Defined Modulo Similar<br>Functionals Carried by the Boundary of that Set ..... | 170 |
| Hyperfunctions .....                                                                                                                                                      | 171 |
| 1.8 Limits .....                                                                                                                                                          | 172 |

|                                                            |                                                                                                                      |     |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|-----|
| 2                                                          | Theory of Boundary Values on the Unit Disc.....                                                                      | 172 |
| 2.1                                                        | Functions $v(t, \theta)$ That Have Strong Boundary Values<br>(Along $t = 0$ ) .....                                  | 173 |
| 2.2                                                        | Boundary Values of Holomorphic Functions on the Unit Disc ...                                                        | 173 |
| 2.3                                                        | Independence on the Defining Function .....                                                                          | 174 |
| 2.4                                                        | The Role of Subharmonicity (Illustrated Here by Discussing<br>the Independence on the Space of Test Functions) ..... | 175 |
| 3                                                          | The Hahn Banach Theorem in the Theory of Analytic Functionals...                                                     | 177 |
| 3.1                                                        | A Hahn Banach Theorem .....                                                                                          | 178 |
| 3.2                                                        | Some Comments .....                                                                                                  | 178 |
| 3.3                                                        | The Notion of Good Compact Set .....                                                                                 | 180 |
| 3.4                                                        | The Case of Non-Stein Manifolds .....                                                                                | 180 |
| 4                                                          | Spectral Theory .....                                                                                                | 181 |
| 5                                                          | Non-linear Paley Wiener Theory and Local Theory<br>of Boundary Values .....                                          | 182 |
| 5.1                                                        | The Paley Wiener Theory .....                                                                                        | 182 |
| 5.2                                                        | Application .....                                                                                                    | 186 |
| 5.3                                                        | Application to a Local Theory of Boundary Values .....                                                               | 186 |
|                                                            | References .....                                                                                                     | 189 |
| <br><b>Extremal Discs and the Geometry of CR Manifolds</b> |                                                                                                                      |     |
