PART A GEOMETRICAL PREREQUISITES FOR THREE-DIMENSIONAL CONTINUUM MECHANICS

CHAPTER 1

VECTORS, DETERMINANTS, AND MOTIVATION FOR TENSORS

3

1.1 Vectors in a Cartesian coordinate system, transformation of vector components, and the summation convention 3

Projection 4 / Transformation of coordinates—Geometric approach 5 / Notation 6 / Vectors—Algebraic point of view 9 / Vectors—Geometric point of view 10 / Review of linear dependence 12

1.2 Determinants and the permutation symbol 14

The permutation symbol 15 / Determinants 16 / The “ed” rule 20

1.3 The consistency requirement 23

The consistency of Newton’s second law 23 / Physical laws: General statement versus particular numerical version 24 / Guessing the tensor transformation law from the consistency requirement 25

1.4 The tensor as a linear transformation 28

Linear transformations 28 / The stress tensor induces a linear transformation of differential area into differential force 29 / A linear transformation of differential area to differential force can be identified with the stress tensor 31

CHAPTER 2

CARTESIAN TENSORS

2.1 Tensor algebra 33

Definitions and elementary properties 34 / Special results for second order tensors 41 / Isotropic tensors 43 / The vector associated with an antisymmetric tensor 46

2.2 The eigenvalue problem 49

Eigenvalues and eigenvectors of symmetric tensors 55 / Principal axes 57

- 2.3 The calculus of tensor functions 60
Theorems for derivatives of tensor fields 63 / *Integral theorems* 64 /
Representation theorems 67
- APPENDIX 2.1 Some basic equations of continuum mechanics 72

PART B

PROBLEMS IN CONTINUUM MECHANICS

CHAPTER 3

VISCOUS FLUIDS

- 3.1 The Navier–Stokes equations 78
Analysis of the local velocity field 78 / *Assumptions that underlie the constitutive equation* 80 / *Derivation of the final equations* 82 / *Boundary conditions* 85 / *Incompressible viscous flow* 86
- 3.2 Exact solutions 93
Solution 1: Plane Couette flow 93 / *Solution 2: Plane Poiseuille flow* 95 /
Solution 3: Rayleigh impulsive flow 98
- 3.3 On boundary layers 105
Comparative magnitudes of viscous and inviscid terms 105 / *Reynolds number* 107 / *Boundary layer equations for steady flow past a flat plate* 107 / *Boundary conditions* 111
- 3.4 Boundary layer flow past a semi-infinite flat plate 115
Formulation 116 / *Blasius similarity solution* 116 / *Defects in the Blasius solution* 118 / *Boundary layer separation* 120 / *Slightly viscous uniform flow past streamlined bodies* 121 / *Slightly viscous uniform flow past bluff bodies* 122
- 3.5 Vorticity changes in viscous fluid motion 129
Vorticity convection and stretching 129 / *Viscous vorticity diffusion and boundary generation* 131 / *Vorticity in two-dimensional flows* 132 / *Vorticity in particular viscous flows* 132 / *Summary of the role of vorticity* 134
- 3.6 Slow viscous flow past a small sphere 135
Formulation 136 / *Solution* 137
- APPENDIX 3.1 Navier–Stokes equations in cylindrical coordinates 138
- APPENDIX 3.2 Generation of confidence in the boundary layer equations by construction of a finite difference scheme for their solution 139

CHAPTER 4

FOUNDATIONS OF ELASTICITY

4.1 Analysis of local motion 144

Strain tensor in material coordinates 144 / Geometrical interpretation of strain components 147 / Strain tensor in spatial coordinates 149 / The rotation tensor 150 / Principal axes of strain 151 / Compatibility equations 153 / Some examples of strain 155

4.2 Hooke's constitutive equation and some exact solutions 159

Generalized Hooke's law 159 / Interpretation of the elastic coefficients via exact solutions 162 / Tension of a cylindrical bar 163 / Shear of a rectangular bar 164 / Compression of a rectangular parallelepiped 166

4.3 Final formulation of the problem of linear elasticity 168

Summary of general equations, boundary conditions, and initial conditions 169 / Navier's equations 171 / Beltrami-Michel equations 174

4.4 Energy concepts and the principle of virtual work 174

Energy balance 174 / Principle of virtual work 177 / Uniqueness theorems 178 / Potential energy minimization in equilibrium 179

4.5 Some effects of finite deformation 184

Kinematics 184 / Comparison with linear theory 187 / A constitutive equation for nonlinear elasticity 188 / Simple shear 189

CHAPTER 5

SOME EXAMPLES OF STATIC PROBLEMS IN ELASTICITY

5.1 Bending of beams 194

Bending by terminal couples: Formulation 194 / Solution 196 / Interpretation 199 / Introduction to the engineering theory of bending—Basic assumptions 200 / Equations of engineering bending theory 204 / Boundary conditions 208 / Traveling-wave solutions 210 / Buckling of a beam 212 / Variational methods in elasticity 214

5.2 St. Venant torsion problem 219

Warping function 220 / Stress function 224 / Further properties of the stress function 226 / Modified stress function 229 / Rectangular cross section 230 / Elliptical cross section 233 / St. Venant principle 235

5.3 Some plane problems 240

Equations for plane strain 241 / Airy's stress function 241 / Boundary conditions 242 / Polar coordinates 245 / Kirsch problem: Stress concentration 248 / Plane stress 250 / Generalized plane stress 252 / Concluding remarks 255

CHAPTER 6

INTRODUCTION TO DYNAMIC PROBLEMS IN ELASTICITY

- 6.1 Elastic waves in unbounded media 259
Dilatational and rotational wave equations 259 / Waves via the Helmholtz representation 260 / Plane wave solutions 261
- 6.2 Propagation of discontinuity surfaces 264
A condition on mild discontinuities 265 / Further jump conditions 266 / Solving for discontinuity velocities 269 / Orientations of discontinuity surfaces 270
- 6.3 Reflection of plane shear waves 271
Formulation 272 / Attempted solution with a reflected wave 273 / Additional reflected wave 274 / Interpretation of results 276
- 6.4 Elastic surface waves 278
Formulation 278 / Solution: Plane waves that decay with depth 279 / Analysis of the solution 281 / Occurrences of Rayleigh waves 283
- 6.5 Internal reflection 285
- 6.6 Love waves 289
Formulation and solution 290 / Examination of the nature of dispersion 293 / Further characteristics of the solution 294 / Concluding remarks 295

PART C

WATER WAVES

CHAPTER 7

FORMULATION OF THE THEORY OF SURFACE WAVES
IN AN INVISCID FLUID

- 7.1 Boundary conditions 301
Kinematic boundary condition 301 / Basic facts about surface tension 303 / Quick derivation of a dynamic boundary condition 304 / Detailed derivation of the dynamic boundary condition for an inviscid fluid 305 / Forces on a surface element 308 / Consequences of local equilibrium 313
- 7.2 Formulation and simplification 319
Equations for two-dimensional waves in an infinitely wide layer of inviscid fluid 320 / Static and dynamic pressure 322 / Nondimensionalization 324 / Linearization 326
- 7.3 Order-of-magnitude estimates, nondimensionalization, and scaling 327
Estimating the size of terms in equations governing water waves 328 / Scaling 329 / Use of dimensionless scaled variables 331 / Pressure scale 332

CHAPTER 8

SOLUTION IN THE LINEAR THEORY

- 8.1 A solution of the linearized equations 335
Assumption of a solution of exponential type 335 / Verification that all conditions are satisfied 336 / Return to dimensional variables 339 / Interpretation of the solution 340
- 8.2 Initial value problems: Periodic cases 346
Superposing solutions of exponential type 346 / Another way to write the real part of complex sums 349 / Satisfying initial conditions 352
- 8.3 Aperiodic initial values 354
Abandoning dimensionless variables 354 / Solution via Fourier integrals 355 / A qualitative feature of the solution 359 / Superposition and the delta function 360
- APPENDIX 8.1 Bessel functions 365

CHAPTER 9

GROUP SPEED AND GROUP VELOCITY

- 9.1 Group speed via the method of stationary phase 369
Need for an asymptotic approximation 369 / Stationary-phase approximation 369 / Application of the approximation 370 / Interpretation: Group speed 374 / Phase speed 375 / Special conditions near extrema of group speed 377 / Some applications to flow past obstacles 378
- 9.2 Experiments and practical applications 381
Experiments on the collapse of a rectangular hump of water 382 / Comparison of theory and experiment 384 / Practical application of theory 388
- 9.3 A kinematic approach to group velocity 391
Properties of slowly varying wave trains 392 / The phase function in regions with an unvarying number of waves 393 / Integral and differential expressions of wave conservation 395 / Group and phase velocity 396 / Energy propagation 397 / Asymptotic form of the surface: A terse derivation 398
- 9.4 Ship, duck, and beetle waves 401
Consequences of steady motion 403 / Steady waves induced by a point source 404 / Partial differential equation for the phase function 408
- APPENDIX 9.1 The method of stationary phase—An informal discussion 412
Motivation 412 / Development of a theorem 414 / Heuristic derivation of the key approximation 415 / Generalization 416

CHAPTER 10

NONLINEAR EFFECTS

10.1 Formation of perturbation equations for traveling waves 418

Change of variables 419 / *Consequence of traveling-wave assumption* 420 / *Series solution* 421 / *Determination of successive sets of equations* 422 / *Remarks* 425

10.2 Traveling finite-amplitude waves 426

Lowest order equations 426 / *Second order equations* 428 / *Normalization* 430 / *Completion of second order calculations* 431 / *Third order calculations* 432 / *Discussion* 434 / *Resonant case* 436 / *Near resonance* 438 / *Special resonant solutions to compare with experiment* 439 / *Recapitulation* 441 / *Final remarks—Formalism and rigor* 442

PART D

VARIATIONAL METHODS AND EXTREMUM PRINCIPLES

CHAPTER 11

CALCULUS OF VARIATIONS

11.1 Extrema of a function—Lagrange multipliers 447

Unconstrained extremalization of a function 448 / *Constrained extremalization of a function* 450 / *Inequality constraints* 455

11.2 Introduction to the calculus of variations 461

The brachistochrone 461 / *A general extremalization problem* 462 / *The Euler equation* 463 / *Natural boundary conditions* 467 / *Are solutions to the Euler equation extremals?* 471

11.3 Calculus of variations—generalizations 476

A. More derivatives 476 / *B. More functions* 477 / *C. More independent variables* 478 / *D. Integral constraint* 479 / *E. Functional constraint* 481 / *F. End point free to move on a given curve* 483

APPENDIX 11.1 Lemma A 496

APPENDIX 11.2 Variational notation 497

CHAPTER 12

CHARACTERIZATION OF EIGENVALUES AND EQUILIBRIUM STATES AS EXTREMA

12.1 Eigenvalues and stationary points 500

Three stationary value problems 500 / *A particular self-adjoint positive problem* 502

12.2	Eigenvalues as minima and the Ritz method	504
	<i>Motivation 504 / Specification of a linear operator 508 / The lowest eigenvalue 509 / Higher eigenvalues 510 / The Ritz method 513 / Validity and utility of the Ritz method 515 / Generalization 517 / Example: Transverse vibrations of a tapered hollow beam 518 / Natural boundary conditions 521</i>	
12.3	The Courant maximum–minimum principle	528
	<i>A problem in vibration theory 528 / The max–min principle 529 / Application to the Ritz method 531</i>	
12.4	Minimal characterization of linear positive problems	533
	<i>Particle equilibrium as a minimum of potential energy 534 / The loaded membrane 537 / Equivalence of an inhomogeneous equation and a minimization problem 539 / The Ritz method applied to the torsion problem 541</i>	
	APPENDIX 12.1 Self-adjoint operators on vector spaces	546
	<i>Real vector spaces 547 / Scalar products 549 / Linear self-adjoint operators 551 / Eigenvalue problems 552 / Positive operators 554 / Orthonormal elements 556 / Inhomogeneous problems 558 / The adjoint 560 / Banach and Hilbert spaces 562 / Completely continuous operators 563</i>
