

L. Ambrosio K. Deckelnick G. Dziuk
M. Mimura V.A. Solonnikov H.M. Soner

Mathematical Aspects of Evolving Interfaces

Lectures given at the C.I.M.-C.I.M.E.
joint Euro-Summer School
held in Madeira, Funchal,
Portugal, July 3–9, 2000

Editors: P. Colli
J.F. Rodrigues

Fondazione
C.I.M.E.

Springer

Table of Contents

Lecture Notes on Optimal Transport Problems

<i>Luigi Ambrosio</i>	1
1 Some elementary examples	3
2 Optimal transport plans: existence and regularity	5
3 The one dimensional case	14
4 The ODE version of the optimal transport problem	16
5 The PDE version of the optimal transport problem and the p -laplacian approximation	29
6 Existence of optimal transport maps	32
7 Regularity and uniqueness of the transport density	38
8 The Bouchitté–Buttazzo mass optimization problem	41
9 Appendix: some measure theoretic results	43
References	50

Numerical Approximation of Mean Curvature Flow of Graphs and Level Sets

<i>Klaus Deckelnick, Gerhard Dziuk</i>	53
1 Introduction	53
Notations	55
2 Mean Curvature Flow of Graphs	55
2.1 The Differential Equation	55
2.2 Some analysis for the problem	56
2.3 Discretization	58
Discretization in Space	58
Fully discrete schemes and stability	59
Convergence of the semi-discrete scheme	61
2.4 Convergence of the fully discrete semi implicit scheme	63
3 Mean Curvature Flow of Level Sets	75
3.1 Viscosity Solutions	75
3.2 Regularization	76
3.3 Convergence of the numerical scheme for the level set problem .	78
The semi-discrete scheme	78
The fully discrete scheme	78

3.4 Numerical Tests for the Level Set Algorithm	81
The regular case.	81
Mildly singular case.	82
The highly singular case.	83
The dumb-bell problem.	83
References	86

Reaction-Diffusion Systems Arising in Biological and Chemical Systems: Application of Singular Limit Procedures

<i>Masayasu Mimura</i>	89
1 What is diffusion?	89
1.1 Discrete diffusion models	89
1.2 Continuous models	90
2 Paradox of diffusion	91
3 Diffusive patterns and waves - bistable RD equations	94
3.1 Scalar bistable RD equation	95
3.2 Two component systems of bistable RD equations	98
4 Resource-consumer RD systems	101
4.1 Bacterial colony model	101
4.2 Grey-Scott model	107
5 Competition-diffusion systems and singular limit procedures	109
5.1 Spatial segregating limits of two competing species model	111
5.2 Dynamics of triple junctions arising in three competing species model.	113
6 Chemotactic patterns - aggregation and colonies	115
6.1 Aggregation of <i>Dictyostelium discoideum</i>	116
6.2 New pattern arising in a chemotaxis-diffusion-growth system ...	117
References	119

Lectures on Evolution Free Boundary Problems: Classical Solutions

<i>Vsevolod A. Solonnikov</i>	123
1 Introduction	124
2 The model problem	128
3 Transformation of the problem (1)	134
4 Proof of Theorem 3.1	138
5 Introduction	142
6 Linear and model problems	146
7 Lagrangean coordinates and local existence theorems	154
8 Proof of Theorem 5.3	162
9 Scheme of the proof of Theorem 5.4	166
References	173

Variational and Dynamic Problems for the Ginzburg-Landau Functional

<i>Halil Mete Soner</i>	177
1 Introduction	177
2 Energy Lower Bounds	183
2.1 Degree and Jacobian	183
2.2 Covering argument	184
2.3 Main lower bound	193
3 Jacobian and the GL Energy	201
3.1 Jacobian estimate	201
3.2 Compactness in two dimensions	207
4 Gamma Limit	213
4.1 Functions of BnV	215
4.2 Gamma limit of I^ϵ	217
5 Compactness in Higher Dimensions	222
6 Dynamic Problems: Evolution of Vortex Filaments	225
6.1 Energy identities	226
6.2 Mean curvature flow and the distance function	227
6.3 Convergence	227
References	231
List of Participants	235
