Contents

Preface	xi
Chapter 1 An Introduction	1
1 Numerical analysis	1
2 Physical examples	7
Chapter 2 Errors in Numerical Computation	15
1 Introduction	15
2 Machine-representable numbers	19
3 Error analysis of floating point arithmetic	23
4 The effects of computational errors: an example	33
Chapter 3 Systems of Linear Equations	43
1 Introduction	43
2 Direct methods of solution for full systems	46
3 <i>LU</i> factorization of a nonsingular matrix	55
4 <i>PLU</i> factorization of a nonsingular matrix	61
5 Band matrices	67
6 Symmetric positive-definite matrices	70
7 Ill conditioning	77
8 Methods for sparse matrices	88
Chapter 4 Interpolation	103
1 Introduction	103
2 Polynomial interpolation	107
3 Lagrangian interpolation	109
4 The error term in Lagrangian interpolation	114
5 Divided differences	116
6 Iterated interpolation	122
7 Approximating a polynomial of degree n by one of degree $n-1$	127
8 Hermite interpolation	134
9 Inverse interpolation	139
10 Piecewise polynomials	142
11 Extrapolation	149

Chapter 5 Least Squares Approximation	150
1 The principle of least squares	150
2 The generation of orthogonal functions	160
3 The recursive generation of orthogonal polynomials	167
Chapter 6 Minimax Approximation	172
1 Introduction	172
2 Padé approximations	173
3 Rational approximation and Chebyshev polynomials	179
4 The construction of minimax approximations; the algorithm of Remes	187
Chapter 7 Numerical Integration	198
1 Introduction	198
2 The coefficients in the Newton-Cotes formulas	207
3 The error term E_I	210
4 Composite rules	220
5 Romberg integration	225
6 Gaussian integration	228
7 Composite Gaussian integration	245
Chapter 8 Numerical Differentiation	249
1 Introduction	249
2 The error term; equally spaced data	251
3 Numerical differentiation formulas for $p = 1$	253
4 Numerical differentiation formulas for $p = 2$	257
Chapter 9 The Solution of Nonlinear Algebraic Equations	261
1 Iteration	261
2 A general first-order method	262
3 The graphical interpretation of the condition for convergence	266
4 The Newton-Raphson method	268
5 The graphical representation of the Newton-Raphson method	275
6 Aitken's process, Steffensen's method, secant method, regula falsi	277
7 The Newton-Raphson method where $F^{(1)}(x) = 0$ close to the root X	293
8 Multiple roots: the case where $F(X) = F^{(1)}(X) = \dots =$ $F^{(p-1)}(X) = 0$	295
9 Systems of nonlinear equations	298
10 Zeros of polynomial F	308
Chapter 10 The Algebraic Eigenvalue Problem	324
1 Introduction	324
2 The power method	340

3	Inverse iteration	348
4	The shifted QR algorithm for symmetric tridiagonal matrices	352
5	QR for Hessenberg matrices—the implicitly shifted method	358
Chapter 11 The Numerical Solution of Ordinary Differential Equations		
	1 Introduction	365
	2 Linear k -step methods	365
	3 Analysis of k -step methods	370
	4 Predictor–corrector methods	374
	5 Runge–Kutta methods	382
	6 Second-order equations	388
	References	397
	References	403
	Index	405
