

COMPUTABILITY AND LOGIC

Third edition

GEORGE S. BOLOS

Professor of Philosophy
Massachusetts Institute of Technology

RICHARD C. JEFFREY

Professor of Philosophy
Princeton University

CAMBRIDGE
UNIVERSITY PRESS

Contents

- Preface ix
Preface to the third edition xi
- 1 Enumerability 1
 - 2 Diagonalization 11
 - 3 Turing machines 19
 - 4 Uncomputability via the busy beaver problem 34
 - 5 Uncomputability via diagonalization 43
 - 6 Abacus computable functions are Turing computable 52
 - 7 Recursive functions are abacus computable 70
 - 8 Turing computable functions are recursive 89
 - 9 First-order logic revisited 96
 - 10 First-order logic is undecidable 112
 - 11 First-order logic formalized: derivations and soundness 121
 - 12 Completeness of the formalization; compactness 131
 - 13 The Skolem-Löwenheim theorem 147
 - 14 Representability in \mathcal{Q} 157
 - 15 Undecidability, indefinability and incompleteness 170
 - 16 Provability predicates and the unprovability of consistency 182
 - 17 Non-standard models of arithmetic 191
 - 18 Second-order logic 197
 - 19 On defining arithmetical truth 207
 - 20 Definability in arithmetic and forcing 212
 - 21 The decidability of arithmetic with addition, but not multiplication 219
 - 22 Dyadic logic is undecidable: 'eliminating' names and function symbols 228
 - 23 The Craig interpolation lemma 234
 - 24 Two applications of Craig's lemma 243
 - 25 Monadic versus dyadic logic 250
 - 26 Ramsey's theorem 260

27	Provability considered modal-logically	268
28	Undecidable sentences	285
29	Non-standard models of Z are not recursive	293
	Index	301
