

Andreas Pomp

The Boundary-Domain Integral Method for Elliptic Systems

Springer

Table of Contents

Abbreviations and Symbols	IX
---------------------------------	----

Introduction	XI
--------------------	----

Part I. The General Theory for Elliptic Systems of Partial Differential Equations

1. Pseudohomogeneous Distributions	3
1.1 Basic Definitions of Homogeneity and Pseudohomogeneity ...	3
1.2 Spherical Harmonics	5
1.3 Fourier Transform	7
1.4 The Canonical Continuation of Homogeneous Functions	7
1.5 Properties of the Canonical Continuation	9
1.6 The Canonical Projection	11
1.7 The Canonical Projection Applied to Pseudohomogeneous Functions	14
1.8 Special Classes of Pseudohomogeneous Distributions	16
1.9 Mapping Properties of Basic Operators	18
1.9.1 Differentiation	18
1.9.2 Multiplication with Homogeneous Polynomials	18
1.9.3 Homogeneous Elliptic Differential Operators	19
1.10 The Right Inverse to Homogeneous Elliptic Differential Operators	20
1.11 Local Convergent Series with Pseudohomogeneous Terms	22
1.12 Basic Operators Acting on Series with Pseudohomogeneous Terms	23
1.12.1 Differentiation	23
1.12.2 Multiplication	23
1.12.3 Homogeneous Elliptic Differential Operators	23
1.12.4 Fourier Transform	24
1.13 The Parity Condition	25

2. Levi Functions for Elliptic Systems of Partial Differential Equations	29
2.1 Definitions of Ellipticity in the Sense of Douglas and Nirenberg	29
2.2 Fundamental Solutions and Levi Functions	31
2.3 Existence Results for Fundamental Solutions	31
2.4 A General Algorithm for the Construction of Levi Functions	32
2.4.1 Assumptions	32
2.4.2 The Steps of the Algorithm	32
2.4.3 Practical Realization	33
2.5 Local Smoothness Properties	34
2.6 Cutting the Higher Order Terms by Projections	36
2.7 Pseudohomogeneous Series Expansions of Fundamental Solutions	37
2.8 The Example of an Ordinary Differential Operator	38
2.9 Global Smoothness Properties	40
2.10 Classical Methods to Construct Fundamental Solutions	42
2.10.1 Systems with Constant Coefficients	42
2.10.2 J. Hadamard's Method	42
2.10.3 Picard's Method of Iterated Kernels	43
2.10.4 F. John's Method	44
2.10.5 The Method of Freezing the Coefficients	44
2.10.6 Comparison of the Methods	44
3. Systems of Integral Equations, Generated by Levi Functions	47
3.1 Transformation of Boundary Value Problems	48
3.1.1 The Direct Method	48
3.1.2 The Indirect Method	49
3.1.3 Comparison of the Methods	50
3.2 On the Unique Solvability of the Integral Equation System	51
3.2.1 Sufficient Conditions	51
3.2.2 An Example for Non-Unique Solvability	51
3.3 Sobolev Spaces	52
3.3.1 Spaces on $\mathbb{R}^n$	52
3.3.2 Spaces on Lipschitz Domains	53
3.3.3 Spaces on the Boundary of Lipschitz Domains	54
3.3.4 Spaces on the Cut Plane	54
3.4 Mellin Transform and Weighted Sobolev Spaces	55
3.5 Cauchy Singular Integral Operators on the Half Axis	56
3.5.1 A Basic Theorem	56
3.5.2 The Jump Relation	61
3.5.3 A Corollary to the Basic Theorem	62
3.6 Integral Operators Considered as Pseudodifferential Operators	63
3.7 Mapping Properties of Integral Operators	65

Part II. Application to the Shell Model of Donnell-Vlasov-Type

4. The Differential Equations of the DV Model	71
4.1 General Remarks to Shell Theory	71
4.2 Assumptions and Properties of the Model	72
4.3 Geometrical Configuration	73
4.4 Shell Equations in Covariant Derivatives	74
4.5 Preliminaries from Differential Geometry	76
4.6 Splitting of the Shell Equations	77
4.6.1 The First Part	78
4.6.2 The Second Part	79
4.7 The Shell Equations in Partial Derivatives	82
4.8 Shell Equations in Isothermal Parametrization	83
4.9 Factorization with Respect to Cauchy-Riemann Operators	83
4.10 Strain-Free Deformations	84
4.11 The Energy Bilinear Form	87
5. Levi Functions for the Shell Equations	89
5.1 Ellipticity of the Operator	89
5.2 Splitting of the Operator into Principal and Remaining Part	90
5.3 Local Isothermal Parametrization	92
5.4 Pseudohomogeneous Functions of Special Structure	93
5.5 Inversion of the Cauchy-Riemann Operators	95
5.6 The Initial Terms of the Levi Function	97
5.7 Mapping Properties of the Individual Operators	100
5.8 The Structure of the Series Terms	102
5.9 Pseudohomogeneous Expansion of the Fundamental Solution	105
5.10 Form of the Remainder	106
5.10.1 The Upper Left Block	106
5.10.2 The Lower Right Entry	107
5.10.3 The Upper Right Block	107
5.10.4 The Lower Left Block	108
6. The System of Integral Equations and its Numerical Solution	109
6.1 Boundary Geometry and the Integral Theorem of Gauss	109
6.2 Boundary Data and Green's Formula	112
6.3 The Integral Equation System for the Dirichlet Problem	115
6.3.1 The Dirichlet Problem	115
6.3.2 Transformation into a System of Integral Equations	115
6.3.3 The Kernel Functions	116
6.3.4 The Enhanced System of Integral Equations	117
6.4 Mapping Properties of the Operator Matrix	118
6.5 Corner Singularities	120

6.6	Galerkin's Method	124
6.7	Error Estimates	125
6.8	Order of Convergence for Quasi-Uniform Meshes	127
6.9	Approximation of the Singular Functions on Graded Meshes ..	128
6.10	Order of Convergence for Graded Meshes	132
6.11	Estimation of the Admissible Local Quadrature Error	133
7.	An Example: Katenoid Shell Under Torsion	137
7.1	Geometry of the Mid-Surface	137
7.2	Shell Equations and Boundary Conditions	139
7.3	Levi Function and Integral Kernels	140
7.3.1	The Levi Function L^Q	140
7.3.2	The Integral Kernel $L^F(x, y)$	141
7.3.3	Further Notations	141
7.3.4	The Integral Kernels V^Q and V^F	141
7.3.5	The Integral Kernel R^Q	142
7.3.6	The Integral Kernel R^F	143
7.3.7	Mapping onto the Neumann Data	144
7.4	The Shell Equations as a Singular Perturbed Problem	144
7.5	Corner Singularities and Mesh Refinement	144
7.6	Discretization of the Integral Operators	145
7.6.1	Far-Field	146
7.6.2	Near-Field	146
7.7	Estimations for the Number of Cubature Sample Points	148
7.8	Numerical Results	152
