Table of Contents

Introduction	vii
Chapter 1 Preliminaries	1
1 Algebras of Events	1
2 Random Variables	1
3 Probabilities and Expectations	2
4 Uniform Integrability	3
5 Conditional Expectations	6
6 Essential Supremum	8
7 Independent Random Variables and the Strong Law of Large Numbers	9
Chapter 2 Martingales. Wald's Lemma. Applications	11
1 Definitions, Examples, Convergence Theorem	11
2 Applications of the Martingale Convergence Theorem	18
3 Stopping Times—Definition and Fundamental Properties	19
4 Applications of Stopping Times	24
5 Some First Passage Problems	28
6 The Martingale $x_n = dQ_n/dP_n$	33
7 Application to the Sequential Probability Ratio Test	36
Chapter 3 Introductory Theory	41
1 Statement of the Problem and Examples	41
2 The Finite Case. Backward Induction	49
3 An Application	51
4 Some Fundamental Lemmas	52
5 The Monotone Case	54
6 Applications	56

Chapter 4	The General Theory	62
1	Definitions and Preliminary Lemmas	63
2	Some General Theorems	66
3	Applications	71
4	A Martingale Characterization of (γ_n) and (γ'_n)	75
5	Extended Stopping Variables. The Triple Limit Theorem	77
6	Examples and Counter-examples	84
7	Optimal Stopping for s_n/n	86
8	The Conditions $V < \infty$ and $E[\sup x_n^+] < \infty$	90
9	An Application to Martingale Theory	98
Chapter 5	The Markov and Independent Cases	101
1	The Markov Case—Definition and Basic Theorems	102
2	The Markov Case—Applications	105
3	Randomized Stopping Rules	110
4	A Problem of G. Elfving	113
5	The Independent Case	118
6	The Independent Case—Applications	121
7	Uniform Games	122
8	The Problem of y_n/n	126
	 Bibliographical Notes	 130
	 Bibliography	 133
	 List of Symbols	 139
	 Index	 141
