# The Theory of Evolution and Dynamical Systems

## Mathematical Aspects of Selection

JOSEF HOFBAUER

Institute of Mathematics, University of Vienna

KARL SIGMUND

IASA, Laxenburg, Austria

 CAMBRIDGE  
UNIVERSITY PRESS

## Table of Contents

Preface	vii
<b>Part 1: Selection dynamics and population genetics: a discrete introduction</b>	
1. The biological background	1
2. The Hardy-Weinberg law	6
3. Selection and the Fundamental Theorem	12
4. Mutation and recombination	22
<b>Part 2: Growth rates and ecological models: an ABC on ODE</b>	
5. The ecology of populations	29
6. The logistic equation	32
7. Lotka-Volterra equations for predator-prey systems	40
8. Lotka-Volterra equations for two competing species	52
9. Lotka-Volterra equations for more than two populations	59
<b>Part 3: Test tube evolution and hypercycles: a prebiotic primer</b>	
10. Prebiotic evolution	72
11. Branching processes and the complexity threshold	77
12. Catalytic growth of self-reproducing molecules	87
13. Permanence and the evolution of hypercycles	97
<b>Part 4: Strategies and stability: an opening in game dynamics</b>	
14. Some aspects of sociobiology	108
15. Evolutionarily stable strategies	113
16. Game dynamics	124
17. Asymmetric conflicts	137
Interlude	147

<b>Part 5: Compete, predate or cooperate: the struggle for permanence</b>	
18. Ecological equations for two species	149
19. Criteria for permanence	160
20. Replicator networks	178
21. Stability in $n$ -species communities	190
22. Some low dimensional ecological systems	211
<b>Part 6: Back to the gene pool: gradients and cycles</b>	
23. The continuous selection model	225
24. Gradient systems	236
25. Selection, mutation and recombination	249
26. Fertility selection	260
<b>Part 7: On sex and games: strategic and genetic evolution</b>	
27. Evolutionary dynamics for bimatrix games	273
28. Game dynamics for Mendelian populations	290
29. Cycles and the Battle of the Sexes	309
Afterword	321
Bibliography	322
Index	337
