Contents

Notation and conventions	xi
1. Introduction	1
Definitions; Elementary embedding theorems; Basic results on existentially closed groups; SQ-universal groups; Local systems.	
2. Centralizers and normalizers of subgroups	9
Maximal subgroups; Centralizers of intersections; Normalizers of subgroups and characteristically simple subgroups; Quotients of certain maximal subgroups by simple subgroups.	
3. ω-Homogeneous groups	25
Definitions; Classes of groups and the properties SC, JEP, AEP, AC; A countable locally finitely presented existentially closed group.	
4. Recursion theory	34
Definitions; 1-1 reducibility; $X \vee Y$; $\text{Rel}(a_1, \dots, a_r)$ and $\text{Rel}(G)$; Enumeration reducibility; Equivalence classes and ideals; The group M_X ; Partial recursive functions and machines; Strongly creative and 1-complete sets; Turing reducibility and positive reducibility; The group G_X ; Ziegler reducibility; Consistent sets.	
5. Applications of The Subgroup Theorem	55
Systems of equations, inequalities, and implications; Groups obtained by imposing solutions of sets of equations and implications; Solutions of recursively enumerable sets of equations, inequalities, and implications; Skeletons and Ziegler reducibility; Finitely generated groups with solvable word problem; Direct products and wreath products.	
6. The Relative-Subgroup Theorem	71
Groups which are finitely presented over other groups; Solutions of sets of equations in relatively finitely presented groups; Relatively universal finitely generated subgroups of existentially closed groups.	
7. Games	82
Definitions; Codes of rules; Enforceability; Equivalence of codes of rules; Enforceable group properties; The existence of 2^{\aleph_1} distinct countable existentially closed groups.	

8. Free products	102
The set $s(X)$ and Ziegler reducibility.	
9. First-order theory of existentially closed groups	110
§9.1. Introduction	110
First-order languages; Formulae; Sentences; Truth values; Models; First-order theories of groups; Gödel's Compactness Theorem.	
§9.2. Existentially closed groups and first-order theory	112
Groups with the same theory; Elementary classes.	
§9.3. Stable evaluation	117
\forall_* -formulae and \exists_* -formulae; fg -complete groups; Stable evaluation of formulae; Stably true sentences; Examples.	
§9.4. Arithmetically related groups	126
Arithmetic sets; Levels; Groups whose relation sets are arithmetic and first-order formulae.	
§9.5. Generic theory	140
R -generic theories and groups; Stable rules and stable truth; (\emptyset, \emptyset) -generic and stable-generic existentially closed groups; Generic groups and arithmetically related groups; Sentences in generic groups.
