## Contents

|                                                        |           |
|--------------------------------------------------------|-----------|
| <b>0 Preliminaries</b>                                 | <b>1</b>  |
| 0.0 Preface                                            | 1         |
| 0.1 Introduction                                       | 2         |
| 0.2 Brownian motion and related processes              | 3         |
| 0.3 Schrodinger                                        | 9         |
| <b>1 Bell polynomials and Gibbs partitions</b>         | <b>13</b> |
| 1.1 Notation                                           | 14        |
| 1.2 Partitions and compositions                        | 14        |
| 1.3 Moments and cumulants                              | 20        |
| 1.4 Random sums                                        | 23        |
| 1.5 Gibbs partitions                                   | 24        |
| <b>2 Exchangeable random partitions</b>                | <b>37</b> |
| 2.1 Finite partitions                                  | 38        |
| 2.2 Infinite partitions                                | 42        |
| 2.3 Structural distributions                           | 46        |
| 2.4 Convergence                                        | 48        |
| 2.5 Limits of Gibbs partitions                         | 50        |
| <b>3 Sequential constructions of random partitions</b> | <b>55</b> |
| 3.1 The Chinese restaurant process                     | 56        |
| 3.2 The two-parameter model                            | 60        |
| 3.3 Asymptotics                                        | 67        |
| 3.4 A branching process construction                   | 72        |
| <b>4 Poisson constructions of random partitions</b>    | <b>77</b> |
| 4.1 Size-biased sampling                               | 78        |
| 4.2 Poisson representation of the two-parameter model  | 81        |
| 4.3 Representation of infinite Gibbs partitions        | 85        |
| 4.4 Lengths of stable excursions                       | 87        |
| 4.5 Brownian excursions                                | 90        |

|           |                                                          |            |
|-----------|----------------------------------------------------------|------------|
| <b>5</b>  | <b>Coagulation and fragmentation processes</b>           | <b>97</b>  |
| 5.1       | Condensates                                              | 98         |
| 5.2       | Fragmentations                                           | 100        |
| 5.3       | Representations of infinite partitions                   | 109        |
| 5.4       | Coagulation and subordination                            | 112        |
| 5.5       | Coagulation - fragmentation duality                      | 116        |
| <b>6</b>  | <b>Random walks and random forests</b>                   | <b>121</b> |
| 6.1       | Cyclic shifts and Lagrange inversion                     | 122        |
| 6.2       | Galton-Watson forests                                    | 125        |
| 6.3       | Brownian asymptotics for conditioned Galton-Watson trees | 129        |
| 6.4       | Critical random graphs                                   | 135        |
| <b>7</b>  | <b>The Brownian forest</b>                               | <b>143</b> |
| 7.1       | Plane trees with edge-lengths                            | 144        |
| 7.2       | Binary Galton-Watson trees                               | 146        |
