

INTRODUCTION TO MINIMAX

by V. F. Dem'yanov
and V. N. Malozemov

*Translated from Russian by
D. Louvish*

DOVER PUBLICATIONS, INC.
New York

CONTENTS

PREFACE	1
Chapter I. BEST APPROXIMATION BY ALGEBRAIC POLYNOMIALS — DISCRETE CASE	6
§1. Statement of the problem	6
§2. Chebyshev interpolation	7
§3. General discrete case; de la Vallée-Poussin algorithm	15
§4. R -algorithm	22
§5. Reduction to linear programming	26
Chapter II. BEST APPROXIMATION BY ALGEBRAIC POLYNOMIALS — CONTINUOUS CASE	31
§1. Statement of the problem	31
§2. Chebyshev theorem. Chebyshev polynomials	32
§3. Limit theorems	37
§4. Remez' method of successive Chebyshev interpolations	40
§5. Method of grids	44
§6*. Behavior of coefficients of polynomials of best approximation	46
Chapter III. THE DISCRETE MINIMAX PROBLEM	50
§1. Statement of the problem	50
§2. Properties of the maximum function	51
§3. Necessary conditions for a minimax	57
§4. Sufficient conditions for a local minimax. Some estimates	66
§5. Method of coordinatewise descent. Method of steepest descent. Counterexamples	73
§6. First method of successive approximations	82
§7. ϵ -Stationary points. Second method of successive approximations ..	91
§8. The D -function. Third method of successive approximations	98
§9. Concluding remarks	107
Chapter IV. THE DISCRETE MINIMAX PROBLEM WITH CONSTRAINTS	113
§1. Statement of the problem	113
§2. Necessary conditions for a minimax	113
§3. Geometric interpretation of the necessary conditions	117
§4. Sufficient conditions for a local minimax with constraints	123

§ 5. Some estimates	127
§ 6. Method of successive approximations	130
Chapter V. THE GENERALIZED PROBLEM OF NONLINEAR PROGRAMMING ..	137
§ 1. Statement of the problem	137
§ 2. Properties of sets defined by inequalities	137
§ 3. Necessary conditions for a minimax	146
§ 4*. Dependence of direction of descent on specific features of Ω	151
§ 5. Lagrange multipliers and the Kuhn-Tucker theorem	155
§ 6. First method of successive approximations	160
§ 7. Determination of (s, μ) -quasistationary points. Second method of successive approximations	170
§ 8. Method of steepest descent. Case of linear constraints	173
§ 9. Nonlinear constraints. Correction of directions	177
§ 10. Penalty functions	182
§ 11. Concluding remarks	185
Chapter VI. THE CONTINUOUS MINIMAX PROBLEM	187
§ 1. Statement of the problem	187
§ 2. Fundamental theorems	187
§ 3. Geometric interpretation of the necessary condition for a minimax. Some corollaries	195
§ 4. Convergence of the grid method	204
§ 5. Special case of the minimax theorem	216
§ 6*. Determination of saddle points on polyhedra.....	221
§ 7. Best approximation of functions of several variables by generalized polynomials	230
§ 8. Best approximation of functions by algebraic polynomials on an interval	236
Appendix I. ALGEBRAIC INTERPOLATION	242
§ 1. Divided differences	242
§ 2. Interpolating polynomials	244
Appendix II. CONVEX SETS AND CONVEX FUNCTIONS	248
§ 1. Convex hulls. Separation theorem	248
§ 2. Convex cones	254
§ 3. Convex functions	260
Appendix III. CONTINUOUS AND CONTINUOUSLY DIFFERENTIABLE FUNCTIONS	264
§ 1. Continuous functions	264
§ 2. Some equalities and inequalities for continuous functions	265
§ 3. Continuously differentiable functions	269

Appendix IV. DETERMINATION OF THE POINT NEAREST THE ORIGIN ON A POLYHEDRON. ITERATIVE METHODS	276
Supplement. ON MANDEL'SHTAM'S PROBLEM	296
NOTES	300
BIBLIOGRAPHY	303
SUBJECT INDEX	307
