Contents

Preface	xi
1 Introduction	1
1.1 On the origin of iterative methods	3
1.2 Further arguments for iterative methods	8
1.3 An example	10
1.4 Performance aspects	11
2 Mathematical preliminaries	15
2.1 Matrices and vectors	15
2.2 Eigenvalues and eigenvectors	17
3 Basic iteration methods	21
3.1 Introduction	21
3.2 The Krylov subspace approach	25
3.3 The Krylov subspace	27
3.3.1 A more accurate basis for the Krylov subspace	30
4 Construction of approximate solutions	33
4.1 The Ritz–Galerkin approach	33
4.2 The minimum norm residual approach	34
4.3 The Petrov–Galerkin approach	34
4.4 The minimum norm error approach	36
5 The Conjugate Gradients method	37
5.1 Derivation of the method	37
5.2 Computational notes	41
5.3 The convergence of Conjugate Gradients	47
5.3.1 Local effects in the convergence behaviour	50

5.4	CG and the normal equations	57
5.5	Further references	63
6	GMRES and MINRES	65
6.1	GMRES	65
6.1.1	A residual vector variant of GMRES	71
6.1.2	Flexible GMRES	74
6.2	The convergence behaviour of GMRES	76
6.3	Some numerical illustrations	78
6.4	MINRES	84
6.5	Rank-one updates for the matrix splitting	87
6.6	GMRESR and GMRES*	91
7	Bi-Conjugate Gradients	95
7.1	Derivation of the method	95
7.2	Another derivation of Bi-CG	97
7.3	QMR	98
7.4	CGS	102
7.4.1	Numerical illustrations	106
7.5	Complex symmetric systems	107
8	How serious is irregular convergence?	115
8.1	Reliable updating	117
8.2	Rounding errors and discretization errors	119
8.3	Effects of rounding errors to Krylov processes	121
8.3.1	The Lanczos recurrence in finite precision	123
8.3.2	Effects of rounding errors on implementations	128
8.3.3	Some considerations for CG	131
9	Bi-CGSTAB	133
9.1	A more smoothly converging variant of CGS	133
9.2	Bi-CGSTAB(2) and variants	138
9.3	More general hybrid Bi-CG methods	141
9.3.1	Numerical experiments	145
10	Solution of singular systems	147
10.1	Only nonzero eigenvalues matter	147
10.2	Pure Neumann problems	148
11	Solution of $f(A)x = b$ with Krylov subspace information	151
11.1	Introduction	151
11.2	Reduced systems	152
11.3	Computation of the inverse of $f(H_{m,M})$	154

11.4	Numerical examples	155
11.5	Matrix sign function	157
12	Miscellaneous	159
12.1	Termination criteria	159
12.2	Implementation aspects	160
12.3	Parallelism and data locality in CG	162
12.4	Parallel performance of CG	166
	12.4.1 Processor configuration and data distribution	167
	12.4.2 Required communication	168
12.5	Parallel implementation of GMRES(m)	169
13	Preconditioning	173
13.1	Introduction	173
13.2	Incomplete LU factorizations	178
	13.2.1 An example of incomplete decompositions	183
	13.2.2 Efficient implementations of ILU(0) preconditioning	186
13.3	Changing the order of computation	187
13.4	Reordering the unknowns	188
13.5	Variants of ILU preconditioners	192
13.6	Hybrid techniques	193
13.7	Element by element preconditioners	196
13.8	Polynomial preconditioning	196
13.9	Sparse Approximate Inverse (SPAI)	197
13.10	Preconditioning by blocks or domains	199
	13.10.1 Canonical enhancement of a linear system	200
	13.10.2 Interface coupling matrix	202
	13.10.3 Other approaches	203
