

Daniele Boffi · Franco Brezzi
Leszek F. Demkowicz · Ricardo G. Durán
Richard S. Falk · Michel Fortin

Mixed Finite Elements, Compatibility Conditions, and Applications

Lectures given at the
C.I.M.E. Summer School
held in Cetraro, Italy
June 26–July 1, 2006

Editors:
Daniele Boffi
Lucia Gastaldi

 Springer

Contents

Preface	v
Mixed Finite Element Methods	
<i>Riccardo G. Durán</i>	1
1. Introduction	1
2. Preliminary Results	2
3. Mixed Approximation of Second Order Elliptic Problems	4
4. A Posteriori Error Estimates	25
5. The General Abstract Setting	34
References	42
Finite Elements for the Stokes Problem	
<i>Davide Buffi, Franco Brezzi, and Michel Fortin</i>	43
1. Introduction	43
2. The Stokes Problem as a Mixed Problem	46
2.1. Mixed Formulation	46
3. Some Basic Examples	50
4. Standard Techniques for Checking the Inf-Sup Condition	56
4.1. Fortin's Trick	56
4.2. Projection onto Constraints	57
4.3. Verfürth's Trick	58
4.4. Space and Domain Decomposition Techniques	60
4.5. Macaulay's Technique	61
4.6. Making Use of the Internal Degrees of Freedom	62
5. Spurious Pressure Modes	66
6. Two-Dimensional Stable Elements	69
6.1. The MINI Element	69
6.2. The Crouzeix-Raviart Element	70
6.3. $P_2^{c,c} - P_1$ Approximation	71
6.4. $Q_h - P_{h-1}$ Elements	72

7. Three-Dimensional Elements	73
7.1. The MINI Element	73
7.2. The Crouzeix-Raviart Element	74
7.3. $P_1^{nc} - P_0$ Approximation	74
7.4. $Q_1 - P_{0,+}$ Elements	75
8. $P_1 - P_{0,+}$ Schemes and Generalized Hood-Taylor Elements	75
8.1. $P_{1,h} - P_{0,h}$ Elements	75
8.2. Generalized Hood-Taylor Elements	76
9. Nearly Incompressible Elasticity, Reduced Integration Methods and Relation with Penalty Methods	83
9.1. Variational Formulations and Admissible Discretizations	85
9.2. Reduced Integration Methods	86
9.3. Effects of Inexact Integration	88
10. Displacement-Free Basis, Divergent Stream Functions	92
11. Other Mixed and Hybrid Methods for Incompressible Flows	96
References	97

Polynomial Exact Sequences and Projection-Based Interpolation with Application to Maxwell Equations

<u>Level-Dependency</u>	101
1. Introduction	101
2. Exact Polynomial Sequences	102
2.1. One-Dimensional Sequences	102
2.2. Two-Dimensional Sequences	105
3. Commuting Projections and Projection-Based Interpolation Operators in One Space Dimension	115
3.1. Commuting Projections, Projection Error Estimates	115
3.2. Commuting Interpolation Operators, Interpolation Error Estimates	117
3.3. Localization Argument	125
4. Commuting Projections and Projection-Based Interpolation Operators in Two Space Dimensions	128
4.1. Definitions and Commutativity	128
4.2. Polynomial Preserving Extension Operators	131
4.3. Right Inverse of the Curl Operator, Discrete Friedrichs Inequality	132
4.4. Projection Error Estimates	133
4.5. Interpolation Error Estimates	137
4.6. Localization Argument	139
5. Commuting Projections and Projection-Based Interpolation Operators in Three Space Dimensions	141
5.1. Definitions and Commutativity	141
5.2. Polynomial Preserving Extension Operators	145
5.3. Polynomial Preserving, Right Inverses of Grad, Curl, and Div Operators, Discrete Friedrichs Inequalities	145
5.4. Projection and Interpolation Error Estimates	149

6 Application to Maxwell Equations: Open Problems	152
6.1 Time-Harmonic Maxwell Equations	152
6.2 So Why Does the Projection-Based Interpolation Matter?	155
6.3 Open Problems	155
References	156

Finite Element Methods for Linear Elasticity

<i>Richard S. Falk</i>	159
1 Introduction	159
2 Finite Element Methods with Strong Symmetry	162
2.1 Composite Elements	162
2.2 Noncomposite Elements of Arnold and Winther	164
3 Exterior Calculus on $\mathbb{R}^n$	167
3.1 Differential Forms	167
4 Basic Finite Element Spaces and their Properties	170
4.1 Differential Forms with Values in a Vector Space	173
5 Mixed Formulation of the Equations of Elasticity with Weak Symmetry	177
6 From the de Rham Complex to an Elasticity Complex with Weak Symmetry	179
7 Well-Posedness of the Weak Symmetry Formulation of Elasticity	180
8 Conditions for Stable Approximation Schemes	182
9 Stability of Finite Element Approximation Schemes	184
10 Refined Error Estimates	185
11 Examples of Stable Finite Element Methods for the Weak Symmetry Formulation of Elasticity	187
11.1 Arnold, Falk, Winther Families	187
11.2 Arnold, Falk, Winther Reduced Elements	188
11.3 PEERS	190
11.4 A PEERS-Like Method with Improved Stress Approximation	191
11.5 Methods of Stenberg	191
References	193

Finite Elements for the Reissner-Mindlin Plate

<i>Richard S. Falk</i>	193
1 Introduction	193
2 A Variational Approach to Dimensional Reduction	196
2.1 The First Variational Approach	196
2.2 An Alternative Variational Approach	198
3 The Reissner-Mindlin Model	199
4 Properties of the Solution	200
5 Regularity Results	201
6 Finite Element Discretizations	203
7 Abstract Error Analysis	204
8 Applications of the Abstract Error Estimates	207
8.1 The Dörfler-Liberman Element [13]	208
8.2 The MITC Triangular Families	210
8.3 The Falk-Tu Elements With Discontinuous Shear Stresses [35]	213

8.4. Linked Interpolation Methods	216
8.5. The Nonconforming Element of Arnold and Falk [11]	218
9. Some Rectangular Reissner-Mindlin Elements	221
9.1. Rectangular MITC Elements and Generalizations [20, 17, 33, 48]	221
9.2. DL4 Method [31]	223
9.3. Ye's Method	223
10. Extension to Quadrilaterals	224
11. Other Approaches	228
11.1. Expanded Mixed Formulations	228
11.2. Simple Modification of the Reissner-Mindlin Energy	228
11.3. Least-Squares Stabilization Schemes	228
11.4. Discontinuous Galerkin Methods [9], [8]	227
11.5. Methods Using Nonconforming Finite Elements	229
11.6. A Negative-Norm Least-Squares Method	230
12. Summary	230
References	230
List of Participants	231
