Contents

Introduction	1
Symbolic notation	3
Chapter I: General mesomechanical model of heterogeneous, statistically homogeneous materials	5
Chapter II: Models of materials with statistically isotropic structure	9
II.1 General features of the model	9
<i>Model description of strain- and stress-distribution; specific stress power; basic relations among internal stress components in the A-Model and strain components in the B-Model; constitutive equations of material constituents; the complete set of basic equations; the complete system of combinations of continuous and discontinuous infrastructures of the material constituents.</i>	
II.2 General model of two-phase materials	26
<i>Both substructures continuous; both substructures discontinuous; inclusions of one material constituent in the matrix of the other; homogeneous stress model; homogeneous strain model.</i>	
II.3 Discussion of separability of deviatoric and isotropic responses of the mesoscopic stress- and strain-components	40
II.4 Demonstrative stress-strain diagrams for two-phase materials	42
<i>Elastic and viscous material constituents; elastic and elastic-plastic material constituents – elastic moduli homogeneous; stress-strain diagrams [flow-curves] of two-phase composites with one phase elastic and the other one rigid-plastic [viscous] with different types of</i>	

continuity of the substructures and under the assumption of homogeneous stress or homogeneous strain.

II.5 Relation between our two-phase model and the exact bounds for macroscopic elastic moduli 46

Relations to the bounds; some special cases; structural parameters independence of Young's moduli; structures corresponding to the bounds; conclusions.

II.6 Confrontation with some theoretical solutions for two-phase materials 57

Rigid spherical inclusions in a viscous matrix; spherical bubbles in a viscous matrix; elastic spheres in a viscous matrix; viscous spheres in an elastic matrix; elastic spheres in an elastic matrix.

Chapter III: Plasticity of polycrystalline metals 64

III.1 Small deformations 65

III.1.1 Solution to the identification problem 66

α) Yield condition in the simple Mises form; the special case of elastic homogeneity.

β) Yield condition taking into account the influence of fluctuations.

III.1.2 Metallic polycrystalline materials under complex loading 74

Numerical examples:

α) Aluminum alloy: (i) combination of tension and torsion, (ii) ratcheting.

β) Mild steel: combination of two modes of tension in two perpendicular directions.

Conclusion.

III.1.3 The influence of the rate of loading upon the stress-strain curve and upon the strength 85

III.1.4 The yield-point jog 89

III.1.5 Residual internal stresses and stored energy 90

III.1.6 Cyclic loading 97

III.2 Finite deformations, continuum damage and localization 100

<i>III.2.1 The process of necking</i>	107
<i>Short specimens; long specimens.</i>	
<i>III.2.2 Continuum damage and material softening without change of Young's modulus</i>	109
<i>Relation to the elastic material with cracks; material softening.</i>	
<i>III.2.3 Application to tension tests of mild steel and aluminum alloy</i>	112
<i>Sorbitic steel; aluminum alloy AlMg3; relation of the observed microstructural changes to our model description of continuum damage; calculated engineering stress-strain diagrams for different lengths of the AlMg3-specimens.</i>	
Chapter IV: Time-Dependent Deformation	121
<i>Burgers model; Lethersich model.</i>	
IV.1 Application to creep of concrete	124
Chapter V: Fracturing	131
V.1 Quasihomogeneous stable microfracturing	131
<i>Model of the matrix; mesomechanical description of an elastic material with quasihomogeneous distribution of cracks with zero volume fraction; quasihomogeneous stable microfracturing; deviatoric loading; uniaxial compressive and tensile loading; constitutive equation of the matrix; model of the inclusions; model of the whole composite; example of application to structural concrete; conclusions.</i>	
V.2 Localized cracking in concrete	143
Chapter VI: Shape memory	151
VI.1 Shape memory resulting from heterogeneity on the atomic scale	151
<i>Applicability of our concept to heterogeneity on the atomic scale; assumptions of our mathematical model; general form of the mathematical model.</i>	
VI.2 Pseudoelasticity	166
<i>Determination of the material parameters; incomplete pseudoelastic transformations in binary alloys.</i>	

VI.3 One-way shape memory effect	172
<i>Numerical example of a unidirectional one-way shape memory.</i>	
VI.4 Two-way shape memory effect	179
VI.5 Discussion of our model for shape memory	184
Chapter VII: Transversely isotropic materials	186
VII.1 Transversely isotropic two-phase model	189
<i>VII.1.1. Solution to the identification problem based on the flow-curve</i>	194
VII.2. Transversely isotropic materials with unidirectional continuous fibers	197
<i>Macroscopic yield condition of materials with unidirectional continuous fibers; solution to the identification problem; description of a concrete fiber-reinforced material.</i>	
Chapter VIII: Appendices	205
Appendix VIII.1 – On the validity of Hill's equation	205
Appendix VIII.2 – Proof of Eq. (II.1.29)	207
Appendix VIII.3 – Deduction of Eqs. (II.2.10) to (II.2.24)	208
Appendix VIII.4 – Deduction of Eqs. (II.2.33) to (II.2.43)	209
Appendix VIII.5 – Determination of the input data for the solution to the identification problem based on the elastic-plastic stress-strain diagram	210
Appendix VIII.6 – Discussion of Eqs. (V.2.8) and (V.2.9)	212
Appendix VIII.7 – Structural parameters of transversely isotropic materials	214
Appendix VIII.8 – Deduction of Eq. (VII.1.1.2)	215
