# RATIONAL FLUID MECHANICS, 1687–1765

(Editor's introduction to EULERI Opera omnia II 12)

|                                                                                                                                                                               |         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| Prologue . . . . .                                                                                                                                                            | IX      |
| Part I. Fluid mechanics in NEWTON's <i>Principia</i> (1687, 1713, 1726) . . .                                                                                                 | XII     |
| Part II. NEWTON's work on the figure of the earth. Further developments in this subject and in the principles of hydrostatics, from HUYGENS to CLAIRAUT (1690—1743) . . . . . | XIV     |
| Part III. EULER's early work on sound and on the physics of air (1727—1737)                                                                                                   | XXII    |
| Part IV. The hydrodynamics of DANIEL and JOHN BERNOULLI (1727—1740)                                                                                                           | XXIII   |
| Part V. Fluid dynamics in EULER's <i>Gunnery</i> (1745) . . . . .                                                                                                             | XXXVIII |
| Part VI. EULER's work on hydraulics (1749—1752) . . . . .                                                                                                                     | XLI     |
| Part VII. <i>Attempt at a theory of the friction of fluids</i> (E 260, 1751) . . . .                                                                                          | XLVIII  |
| Part VIII. D'ALEMBERT's <i>Essay on a new theory of the resistance of fluids</i> (1749)                                                                                       | L       |
| Part IX. <i>Researches on the motion of rivers</i> (E 332, 1750—1751) . . . . .                                                                                               | LVIII   |
| Part X. <i>Principles of the motion of fluids</i> (E 258, 1752) . . . . .                                                                                                     | LXII    |
| Part XI. <i>General principles of the state of equilibrium of fluids</i> (E 225, 1753)                                                                                        | LXXV    |
| Part XII. <i>General principles of the motion of fluids</i> (E 226, 1755) . . . . .                                                                                           | LXXXIV  |
| Part XIII. <i>Sequel to the researches on the motion of fluids</i> (E 227, 1755) . . .                                                                                        | XCI     |
| Part XIV. <i>Enlightenment regarding the resistance of fluids</i> (E 276, 1756) . .                                                                                           | C       |
| Part XV. <i>On the motion of fluids arising from different degrees of heat</i> (E 331, 1764) . . . . .                                                                        | CVII    |
| Part XVI. The later hydrodynamical papers of D'ALEMBERT (1761—1768)                                                                                                           | CXII    |
| Part XVII. Hydrodynamical theory in EULER and LAGRANGE's researches on the propagation of sound (1759—1761) . . . . .                                                         | CXIX    |

# INDEX

Insunt in hoc volumine indicis ENESTROEMIANI commentationes
