Integral representations for spatial models of mathematical physics

Contents

0	Introduction and some remarks on generalizations of complex analysis	1
1	α-holomorphic function theory	23
1	Algebras of real and complex quaternions	23
2	Helmholtz operator with complex and quaternionic wave number	29
3	Notion of α -holomorphic function	49
4	Integral formulas for α -holomorphic functions	65
5	Boundary value properties of α -holomorphic functions	82
6	Boundary value problems for α -holomorphic functions	113
7	Vectorial reformulation of some quaternionic objects and results	118
2	Electrodynamical models	123
8	The classical Maxwell equations	123
9	Relation between electromagnetic fields and α -holomorphic functions	127
10	Integral representations of electrodynamical quantities	132
11	Boundary value problems for time-harmonic electromagnetic fields	138
3	Massive spinor fields	147
12	The classical Dirac equation and its biquaternionic reformulation	147
13	Integral representations and boundary value problems for time-harmonic spinor fields	158

14	Boundary integral criteria for the MIT bag model	163
4	Hypercomplex factorization, systems of non-linear partial differential equations generated by Füter-type operators	169
15	Notion of hypercomplex factorization and applications to mathematical physics	169
16	Self-duality equation and other systems of non-linear partial differential equations generated by the Füter-type operators	182
	Appendices	191
1	Real quaternions	191
2	Representations of real quaternions	210
3	Complex quaternions	220
4	α -holomorphic functions of two real variables	226
	Bibliography	235
	Index	246
