Foreword to the Third Edition	xxxv		
Preface to the Third Edition	xxxvii		
1. Radiation Physics and Radionuclide Decay			
I. Introduction	2		
II. Discovery and Early Characterization of Radioactivity	2		
III. Basic Units and Definitions	13		
A. Properties of Atomic Constituents	13		
B. Nuclides, Isotopes, Isobars, Isomers, and Isotones	13		
C. Mass and Energy	14		
IV. Properties of the Nucleus	16		
A. Nuclear Radius and Density	16		
B. Nuclear Forces	17		
C. Binding Energy	19		
1. Nuclear Fission	21		
2. Nuclear Fusion	21		
D. Nuclear Models	23		
1. Liquid Drop Model	23		
2. Shell Model	26		
3. Collective Model	29		
E. Cluster Radioactivity	31		
V. Naturally Occurring Radionuclides	32		
A. Radionuclides of Cosmogenic Origin	32		
B. Long-lived Radionuclides	32		
C. Natural Radioactive Decay Chains	33		
VI. Artificially Produced Radionuclides	33		
VII. Nuclear Reactions	37		
A. Reactions Types	37		
B. Notation	39		
C. Energy of Reactions (Q Value)	39		
D. Reaction Cross Section	41		
VIII. Particulate Radiation	42		
A. Alpha Decay	42		
1. Energy and Half-life Relationship	42		
2. Decay Energy	43		
3. Alpha-particle Interactions with Matter	45		
B. Beta Decay	49		
1. Negatron (β^-) Emission	49		
2. Positron (β^+) Emission	54		
3. Electron Capture (EC)	57		
4. Branching β^- , β^+ , and EC Decay	60		
5. Double-Beta ($\beta\beta$) Decay	62		
6. Beta-particle Interactions with Matter	65		
7. Beta-particle Absorption and Transmission	67		
C. Internal Conversion Electrons	68		
D. Auger Electrons	70		
E. Neutron Radiation	72		
1. Discovery of the Neutron	72		
2. Neutron Classification	73		
3. Sources of Neutrons	76		
4. Interactions of Neutrons with Matter	84		
5. Neutron Attenuation and Cross Sections	87		
6. Neutron Decay	90		
IX. Electromagnetic Radiation — Photons	90		
A. Dual Nature: Wave and Particle	90		
B. Gamma Radiation	92		
C. Annihilation Radiation	94		
D. X-Radiation	94		
1. X-rays Characterized by Discrete Spectral Lines	95		
2. Bremsstrahlung	97		
3. X-rays from Beta-particle Emissions	101		
E. Cherenkov Radiation	102		
X. Interaction of Electromagnetic Radiation with Matter	105		
A. Photoelectric Effect	105		
B. Compton Effect	105		
C. Pair Production	107		
D. Combined Photon Interactions	109		
XI. Radioactive Nuclear Recoil	113		
A. Relativistic Expressions	114		
B. Nonrelativistic Expressions	115		
1. Nuclear Recoil Energy from Alpha-particle Emissions	115		
2. Nuclear Recoil Energy from Gamma-ray, X-ray, and Neutrino Emissions	116		
C. Sample Calculations	116		
1. Nuclear Recoil from Alpha Emissions	116		
2. Nuclear Recoil from Beta Emissions	116		
3. Nuclear Recoil from Gamma-ray Photon, X-ray Photon, or Neutrino Emissions	117		

D. Radioactive Recoil Effects	118	1. High-Resolution Gamma-Spectra	179
1. Szilard–Chalmers Process	118	2. Low-Resolution Gamma-Spectra	182
2. Radioactive Disequilibrium	120	VII. Metrology Applications	183
XII. Cosmic Radiation	120	A. Uncertainty Budget	183
A. Classification and Properties	121	B. Uncertainty Calculation	184
B. Showers of the Cosmic Radiation	123	1. Uncertainty Transmission in	
C. Cosmic Rays, Underground	127	Eqn (2.109)	184
D. Origins of Cosmic Radiation	128	2. Numerical Calculation of Uncertainty	186
XIII. Radiation Dose	128	References	188
XIV. Stopping Power and Linear Energy Transfer	130	Relevant Statistical References Tables	189
A. Stopping Power	130		
B. Linear Energy Transfer	133	3. Gas Ionization Detectors	
XV. Radionuclide Decay, Ingrowth, and Equilibrium	135	I. Introduction: Principles of Radiation Detection by Gas Ionization	191
A. Half-Life	135	II. Characterization of Gas Ionization Detectors	192
B. General Decay Equations	141	A. Ion Chambers	192
C. Secular Equilibrium	141	B. Proportional Counters	193
D. Transient Equilibrium	143	C. Geiger–Müller Counters	193
E. No Equilibrium	145	III. Definition of Operating Characteristics of Gas Ionization Detectors	193
F. More Complex Decay Schemes	145	A. Counting Efficiency	194
XVI. Radioactivity Units and Radionuclide Mass	146	B. Energy Resolution	194
A. Units of Radioactivity	146	C. Resolving Time	194
B. Correlation of Radioactivity and Radionuclide Mass	147	D. Localization	194
1. ^{32}P , half-life = 14.3 days	147	IV. Ion Chambers	194
2. ^{14}C , half-life = 5730 years	147	A. Operating Modes of Ion Chambers	195
C. Carrier-Free Radionuclides	148	1. Ion Chambers Operating in the Current Mode	195
References	148	2. Charge Integration Ionization Chambers	195
		3. Pulse-Mode Ion Chambers	195
2. Radioactivity Counting Statistics		B. Examples and Applications of Ion Chambers	195
I. Introduction	163	1. Calibration of Radioactive Sources	195
II. Statistical Distributions	164	2. Measurement of Gases	196
A. The Poisson Distribution	164	3. Frisch Grid Ion Chambers	196
B. The Gaussian Distribution	165	4. Radiation Spectroscopy with Ion Chambers	197
III. Analysis of a Sample of Results	167	5. Electret Detectors	199
A. Best Estimate of the True Value	167	6. Fission Chambers	199
B. Best Estimate of Precision	168	V. Proportional Gas Ionization Detectors	200
C. Error Propagation	168	A. Examples and Applications of Proportional Counters	201
D. Accuracy of the Mean Value	169	1. Gross Alpha–Beta Counting, Alpha–Beta Discrimination, and Radiation Spectroscopy Using Proportional Gas Ionization Counters	201
E. Combination of Measurements	170	2. Position-Sensitive Proportional Counters	203
F. The Statement of the Results	171	3. Low-Level Counting Techniques Using Proportional Gas Ionization Detectors	209
1. Combined Standard Uncertainty	171	4. Application in Environmental Monitoring, and Health Physics	210
2. Rules for Expressing Results	171	VI. Geiger–Müller Counters	214
IV. Statistical Inference	172	A. Designs and Properties of Geiger–Müller Counters	214
A. Hypothesis Testing	172	1. Fill Gas	214
B. Confidence Intervals	173		
C. Statistical Inference	173		
1. Variance of a Population	173		
2. Variance of Two Populations	174		
V. Regression	176		
A. Linear Regression	176		
1. Confidence Intervals and Hypothesis Testing	177		
VI. Detection Limits	177		
A. Critical Levels	177		
B. Gamma-Spectra	179		

2. Quenching	214	5. Applications of Proton Detection	247
3. Plateau	215	B. α -Particles	248
4. Applications	215	1. Suitable Detectors for α -particle Measurements	248
vii. Special Types of Ionization Detectors	216	2. α -Intensity Measurements	248
A. Neutron Detectors	216	3. α -Particle Energy Measurements	250
1. BF ₃ Tube Construction	217	4. α -Spatial Distribution Measurements	250
2. Detectors for Fast Neutrons	218	5. Applications of α Detection	251
3. Neutron Counting in Nuclear Analysis of Fissile Materials and Radioactive Waste	220	C. Fission Fragments	251
4. Moisture Measurements	221	1. Suitable Detectors for Fission Fragments	252
B. Multiple Sample Reading Systems	221	2. Fission Rate Determination	253
C. Self-Powered Detectors	222	3. Spatial Distribution of Fission and Fission Fragments	254
D. Self-Quenched Streamer	223	4. Application of Fission Detection	254
E. Long-Range Alpha Detectors	223	D. Heavy Ions ($Z \geq 3$)	254
F. Liquid Ionization and Proportional Detectors	224	1. Suitable Detectors for Heavy Ions $Z \geq 3$	254
G. Dynamic Random Access Memory Devices (DRAM)	224	2. Identification of Charge Z	255
References	225	3. Identification of Mass A of Isotopes	255
		4. Heavy-Ion Energy Determination	255
		5. Applications of Heavy-Ion Detection	255
4. Solid-State Nuclear Track Detectors		E. Neutrons	255
Part 1 Elements	234	1. Principles of Neutron Detection	255
I. Introduction	234	2. Suitable Detectors for Neutron Detection	256
II. Detector Materials and Classification of Solid-State Nuclear Track Detectors	236	3. Neutron Intensity Measurements	256
A. Crystalline Solids	236	4. Neutron Energy Measurements	256
1. Muscovite Mica	237	5. Neutron Dosimetry	256
2. Apatite	237	F. Exotic Particle Detection	257
3. Zircon	238	1. Suitable Detectors for Exotic Particle Detection	257
4. Sphene	239	2. Magnetic Monopole Detection	257
5. Olivine	239	3. Dark Matter Particle Detection	258
6. Pyroxene	239	IV. Track Formation Mechanisms and Criteria	258
7. Other Crystalline Solids	240	A. Introduction	258
B. Glasses	240	B. Track Formation Mechanisms	258
1. Man-Made Glasses	240	1. Ion Explosion Spike for Inorganic Solids	258
2. Natural Glasses	241	2. Chain Breaking Mechanism in High Polymers	258
C. Plastics	241	C. Criteria of Track Formation	259
1. CR-39 (Polyallyldiglycol carbonate, PADC, PM-355, PM-500, PM-600)	241	1. Primary Ionization Rate Criterion	259
2. Polycarbonate (PC, Lexan, Makrofol, Taffak)	242	2. Restricted Energy Loss (REL) for Plastic Track Detectors	260
3. Cellulose Nitrate (CN, LR-115, Daicell)	243	3. Energy Deposition Model (E_v)	260
4. Polyethylene Terephthalate (PET, Mylar, Cronar, Melinex, Lavsan, Terphane, Hostphan)	244	D. Extended and Transitional Criteria	261
5. CR-39-DAP Series	244	1. Z_{eff}/β	261
6. Other New Track Detector Materials	245	2. dE/dx Transitional Parameter	262
III. Recordable Particles with Solid-State Nuclear Track Detectors	245	V. Track Revelation	262
A. Protons	245	A. Chemical Etching (CE)	262
1. Suitable Detectors for Proton Detection	246	1. Etching Condition	262
2. Proton Intensity Measurements	246	2. Track Etching Geometry	262
3. Proton Energy Measurements	246	3. Critical Angle of Etching	263
4. Proton Spatial Distribution Measurements	247	4. Techniques of Critical Angle Measurements	263
		5. Track Etching Geometry	264
		6. New Progress in Track Etching Geometry	264

B. Electrochemical Etching (ECE)	264	III. Earth and Planetary Sciences	280
C. Track Etching Kinetics	265	A. Fission Track Dating	280
1. Objectives and Required Parameters	265	1. Absolute Approach	280
2. Forward Calculation	266	2. Zeta Approach	282
3. Inverse Calculation	266	3. Continental Drift and Ocean-Bottom Spreading	283
VI. Particle Identification	266	4. Archaeology and Anthropology	283
A. Maximum Track Length Method	266	5. Tectonic Up-Lift Rate Determination	285
B. Track-Etch Rate Versus Radiation Damage Density Method	266	B. Geothermal Chronology	285
C. Track-Etch Rate Versus Residual Range Method	266	C. U and Oil Exploration and Earthquake Prediction	286
D. Track Diameter Method for Identification of Charge Z at High and Relativistic Energy	267	IV. Life and Environmental Sciences	286
E. Track Length Method for Identification of Charge Z at High and Relativistic Energy	269	A. Radiation Protection Dosimetry	286
VII. Track Fading and Annealing	269	1. Radon and Thoron Monitoring and Dosimetry	286
A. Track Fading and Annealing	269	2. Neutron Dosimetry	287
B. Mechanisms of Track Fading	269	B. Environmental Sciences	287
C. Arrhenius Diagram	269	1. Radioactive Fallout from Nuclear Accidents	287
D. Application of Track Fading and Annealing	270	2. Drainage Contamination of Nuclear Plants	289
1. Problems Resulting From Track Fading	270	V. NanoTechnology and Radiation Induced Material Modifications	289
2. Improving Analysis with the Aid of Track Annealing	270	Acknowledgments	289
3. Apparent Fission Track Age and Its Corrections	270	References	289
4. Geothermal Chronology	271		
VIII. Instrumentation	271	5. Semiconductor Detectors	
A. Size of Latent Tracks and Etched Tracks	271	I. Introduction	299
B. Optical Microscope	271	A. The Gas-Filled Ionization Chamber	299
C. Track Image Analyzer	271	B. The Semiconductor Detector	300
D. Electron Microscope	271	C. Fundamental Differences Between Ge and Si Detectors	301
E. Scanning Tunneling Microscope (STM) and Atomic Force Microscope (AFM)	271	1. The Energy Gap	301
F. Spark Counter	272	2. The Atomic Number	301
		3. The Purity or Resistivity of the Semiconductor Material	303
Part 2 Applications	272	4. Charge Carrier Lifetime τ	303
I. Introduction	272	II. Ge Detectors	303
II. Physical Sciences and Nuclear Technology	272	A. High-Purity Ge Detectors: Merits and Limitations	303
A. Cluster Radioactivities	273	B. Analysis of Typical γ Spectra	305
B. Heavy-Ion Interactions	273	1. Spectrum of a Source Emitting a Single γ ray with $E_\gamma < 1022$ keV	305
1. Relativistic Projectile Fragmentation	273	2. Spectrum of a Multiple- γ -Ray Source Emitting at Least One γ -ray with an Energy ≥ 1022 keV	307
2. Sequential Fission after Inelastic Collisions	273	3. Peak Summation	308
C. Nuclear Fission and Neutron Physics	273	4. True Coincidence Summing Effects	309
1. Nuclear Fission	273	5. Ge-Escape Peaks	312
2. Neutron Physics	275	C. Standard Characteristics of Ge Detectors	312
D. Plasma Physics	275	1. Energy Resolution	312
1. Laser Acceleration	275	2. The Peak-to-Compton Ratio	315
2. Inertial-Confinement-Fusion	276	3. The Detector Efficiency	315
E. Astrophysics and Cosmic Rays	276	D. Background and Background Reduction	319
F. Nuclear Technology	277	1. Background in the Presence of a Source	319
1. Nuclear Reactor Physics	277		
2. Accelerator - Driven Subcritical Reactors (ADS)	278		
3. Nuclear Forensic Analysis and Nuclear Safeguards	278		
G. Elemental Analysis and Mapping	280		

2. Background in the Absence of the Source	319	B. Counting Efficiency	388
3. Background of Cosmic Origin	326	C. Background and Contamination in Alpha Spectrometry	389
4. Background Reduction	326	D. Stability of the Alpha Spectrometer	390
E. The Choice of a Detector	331	V. Radiochemical Processing	390
1. General Criteria	331	A. Sample Preparation and Pretreatment	394
2. Increasing the size of HPGe detectors	331	1. Preparation of Solid Samples	394
3. The Germanium Well-Type Detector	332	2. Preconcentration of Liquid Samples and Sample Solutions	394
4. Limitations to the "Relative Efficiency" quoted for Coaxial Detectors	332	B. Chemical Separation	396
5. The Broad Energy Germanium, or "BEGe" detector	333	1. Separations by Liquid-liquid Extraction (LLE)	396
III. Si Detectors	334	2. Separations by Ion Exchange	399
A. Si(Li) X-Ray Detectors	334	3. Separations by Extraction Chromatography (EC)	401
B. Si-Charged Particle Detectors	334	C. Alpha Source Preparation	409
1. Alpha Detectors	335	VI. Determination of Alpha Activity and Recovery	409
2. The Si Drift Detector (SDD) technology	338	A. Calibration	410
3. Electron Spectroscopy and β -Counting	339	B. Measurement Procedure	410
4. Readout of scintillators	339	C. Alpha Spectrum Evaluation	411
5. Continuous Air Monitoring	340	1. Principle of Evaluation	411
IV. Spectroscopic Analyses with Semiconductor Detectors	342	2. Nuclide Identification	411
A. Sample Preparation	343	3. Peak Area Determination for Nonoverlapping Peaks	411
1. Sample Preparation for Alpha Spectrometry	343	4. Peak Area Determination with Correction for Overlapping Peaks	411
2. Sample Preparation for Gamma Spectrometry	350	5. Calculation of Results	412
B. Analysis - Analytical Considerations	351	6. Calculation of the Combined Standard Uncertainty	413
1. Analytical Considerations in Alpha Spectrometry	351	7. Calculation of the Decision Threshold and the Detection Limit	414
2. Analytical Considerations in Gamma Spectrometry	353	VII. Quality Control	415
References	360	A. Quality Control for Alpha Spectrometers	415
		B. Validation of the Procedure	415
		VIII. Conclusions	416
		Terms and Definitions, Symbols and Abbreviations	416
		References	416
6. Alpha Spectrometry		7. Liquid Scintillation Analysis: Principles and Practice	
I. Introduction	364	I. Introduction	424
II. Alpha Decay and Alpha-Emitting Nuclides	365	II. Basic Theory	424
III. Detection Systems	368	A. Scintillation Process	424
A. Detectors	369	B. Alpha-, Beta-, and Gamma-Ray Interactions in the LSC	426
1. Interaction of Alpha Radiation with Detector Materials	369	C. Cherenkov Photon Counting	427
2. Characterization of Spectroscopic Detectors	371	III. Liquid Scintillation Counter (LSC) or Analyzer (LSA)	428
3. Gas Ionization Detectors	372	IV. Quench in Liquid Scintillation Counting	430
4. Semiconductor Silicon Detectors	373	V. Methods of Quench Correction in Liquid Scintillation Counting	433
5. Scintillation Detectors	375	A. Internal Standard (IS) Method	433
6. Cryogenic Detectors	379	B. Sample Spectrum Characterization Methods	434
B. Electronic Units	379	C. External Standard Quench-Indicating Parameters	438
IV. Characteristics of the Alpha Spectrum	380		
A. Peak Shape and Spectrum Analysis	380		
1. Peak Shape and Spectrum Analysis with Si Detectors	380		
2. Peak Shape and Spectrum Analysis with Gas Ionization Detectors	386		
3. Peak Shape and Spectrum Analysis with Liquid Scintillation Detectors	387		
4. Peak Shape with Cryogenic Detectors	387		

D. Preparation and Use of Quenched Standards and Quench-Correction Curves	446	E. Practical Applications of α/β Discrimination and Analysis	537
E. Combined Chemical and Color Quench Correction	449	XVI. Plastic Scintillators in LSC	539
F. Direct DPM Methods	451	XVII. Scintillation in Noble Liquids	542
VI. Analysis of X-Ray, Gamma-Ray, Atomic Electron and Positron Emitters	456	XVIII. Radionuclide Identification	543
VII. Common Interferences in Liquid Scintillation Counting	460	XIX. Air Luminescence Counting	546
A. Background	460	XX. Liquid Scintillation Counter Performance	548
B. Quench	460	A. Instrument Normalization and Calibration	548
C. Radionuclide Mixtures	460	B. Assessing LSA Performance	548
D. Luminescence	461	C. Optimizing LSC Performance	549
E. Static	464	References	554
F. Wall Effect	464		
VIII. Multiple Radionuclide Analysis	465	8. Sample Preparation Techniques For Liquid Scintillation Analysis	
A. Conventional Dual- and Triple-Radionuclide Analysis	466	I. Introduction	576
B. Three-Over-Two Fitting and Digital Overlay Technique (DOT)	475	II. LSC Cocktail Components	576
C. Full Spectrum DPM (FS-DPM)	476	A. Solvents	576
D. Recommendations for Multiple Radionuclide Analysis	477	B. Scintillators	577
E. Complex Spectral Analysis	477	C. Surfactants	578
IX. Radionuclide Standardization	491	1. Nonionics	578
A. CIEMAT/NIST Efficiency Tracing	491	2. Anionics	578
B. New Method of Secondary Standardization by LSC	504	3. Cationics	579
C. Triple-to-Double Coincidence Ratio (TDCR) Efficiency Calculation Technique	505	4. Amphoterics	579
D. $4\pi\beta-\gamma$ Coincidence Counting	511	D. Cocktails	579
X. Neutron/Gamma-Ray Measurement and Discrimination	512	III. Dissolution	579
A. Detector Characteristics and Properties	512	A. Anions	582
B. Neutron/Gamma-ray (n/γ) Discrimination	516	B. Low Ionic Strength Buffers	582
XI. Double Beta ($\beta\beta$) Decay Detection and Measurement	520	C. Medium-Ionic-Strength Buffers	582
XII. Detection and Measurement of Neutrinos	522	D. High-Ionic-Strength Buffers	583
A. Reines and Cowan Reaction	522	E. Acids	584
B. Liquid Scintillation Schemes for Neutrino Detection and Measurement	523	F. Alkalis	584
C. Collaborations for LS Neutrino Detection and Measurement	525	G. Other Aqueous Sample Types	584
XIII. Microplate Scintillation and Luminescence Counting	526	H. Selection and Suitability of a Cocktail Based on Ionic Strength	586
A. Detector Design and Background Reduction	526	IV. Solubilization	586
B. Applications	527	A. Systems	586
C. Advantages and Disadvantages	528	B. Sample Preparation Methods	586
XIV. PERALS and LS Alpha-Spectrometry with LAAPDs	528	1. Whole Tissue	587
A. PERALS Spectrometry	528	2. Muscle (50–200 mg)	587
B. LS Alpha-Spectrometry with LAAPDs	531	3. Liver	587
XV. Simultaneous α/β Analysis	532	4. Kidney, Heart, Sinew, Brains, and Stomach Tissue	588
A. Establishing the Optimum PDD Setting	533	5. Feces	588
B. α/β Spillover Corrections and Activity Calculations	534	6. Blood	589
C. Optimizing α/β Discrimination in PDA	535	7. Plant Material	589
D. Quenching Effects in α/β Discrimination	536	8. Electrophoresis Gels	590
		V. Combustion	592
		VI. Comparison of Sample Oxidation and Solubilization Techniques	593
		A. Solubilization	593
		B. What is Sample Combustion?	593
		C. Advantages and Disadvantages	593
		1. Solubilization Methods and Suitability	593
		2. Sample Combustion Methods and Suitability	594
		VII. Carbon Dioxide Trapping and Counting	596
		A. Sodium Hydroxide	596

B. Hyamine Hydroxide	596	C. Biodegradability	620
C. Ethanolamine	597	1. Testing for Biodegradability	620
D. CarbonTrap and Carbo-Sorb E	597	2. Biodegradability Test Methods	620
VIII. Biological Samples Encountered in Absorption, Distribution, Metabolism, and Excretion	597	D. Incineration	621
