Contents

CHAPTER I. MATHEMATICAL PRELIMINARIES

Introduction 1

1. Function spaces, convex analysis, variational convergence 1

1.1. Function spaces: L^p and Sobolev spaces 1

1.1.1. Lebesgue spaces L^p 1

1.1.2. Sobolev spaces and trace operators 4

1.2. Elements of convex analysis and duality, minimization theorems, multivalued mappings 14

1.2.1. Convex sets and functions 14

1.2.2. Minimization theorems 21

1.2.3. Normal integrands, integral functionals and Rockafellar's theorem . 25

1.2.4. Quasiconvexity and A-quasiconvexity 27

1.2.5. Elements of the duality theory 30

1.2.6. Set-valued maps 34

1.3. Variational convergence of sequences of operators and functionals 35

1.3.1. G-convergence 36

1.3.2. H-convergence and the energy method 37

1.3.3. Two-scale convergence 45

1.3.4. Γ-convergence 47

1.3.5. Γ-convergence of sequence of nonconvex functionals convex in highest-order derivatives: non-uniform homogenization 49

1.3.6. Γ-convergence and duality 52

1.3.7. Convergence of sets in Kuratowski's sense 64

1.4. Two approximation results 65

1.5. An augmented Lagrangian method for problems with unilateral constraints . 78

CHAPTER II. ELASTIC PLATES

Introduction 85

2. Three-dimensional analysis and effective models of composite plates 88

2.1. Equilibrium problem of a periodic plate 88

2.2. Family of problems (P_ε) 90

2.3. Asymptotic analysis. Effective moduli and local problems 94

2.4. Case of transverse symmetry 102

2.5. Centrosymmetry of the periodicity cell 103

2.6. On computing effective stiffnesses 104

2.7. Case of moderately thick periodicity cells 105

2.8. Case of thin periodicity cells. Derivation by imposing Kirchhoff's constraints 109

2.9. Case of transversely slender periodicity cells of constant thickness 112

2.10. Γ-convergence and justification of three models of thin, transversely inhomogeneous and anisotropic plates with constant thickness 116
2.10.1. Basic relations 116
2.10.2. Justification of the effective plate model of Sec. 2.8 by passing to zero: $e \to 0$ and then $\varepsilon \to 0$ 120
2.10.3. Justification of the effective plate model of Sec. 2.9 by passing to zero: $\varepsilon \to 0$ and next $e \to 0$ 136
2.10.4. Justification of the effective plate model of Sec. 2.3 by passing to zero: $e \to 0$ and $\varepsilon \to 0$ simultaneously 138
2.11. Effective stiffnesses of longitudinally homogeneous plates 151

3. Thin plates in bending and stretching 153
3.1. Kirchhoff type description 153
3.2. Asymptotic homogenization. In-plane scaling approach 157
3.3. Refined scaling approach 164
3.4. Variational formulae for effective stiffnesses 166
3.5. Correctors 168
3.6. Variational formulae for effective compliances. Dual effective potential ... 172
3.7. Transversely symmetric plates periodic in one direction 173
3.8. Ribbed plates. Bending problem 175
3.8.1. Formula of Francfort and Murat for stiffnesses 176
3.8.2. Ribbed plates of higher rank with the stronger phase taken as an envelope 179
3.8.3. Formula of Lurie-Cherkaev-Fedorov for stiffnesses 181
3.8.4. Formula of Francfort-Murat-type for compliances 182
3.9. Ribbed plates. Plane elasticity problem 183
3.9.1. Formula of Francfort and Murat for stiffnesses 183
3.9.2. Formula of Francfort and Murat-type for compliances 185
3.10. Plates periodic with respect to a curvilinear parametrization. Non-uniform homogenization 188
3.11. Effective bending stiffnesses of plates with quadratic inclusions 190
3.12. Perforated plates 195
3.13. Plates stiffened with rigid inclusions 200

4. Nonlinear behavior of plates 203
4.1. Von Kármán equations 203
4.2. Homogenization 205
4.3. Bifurcation and homogenization of perforated von Kármán plates 209
4.3.1. Homogenization of perforated von Kármán plates 209
4.3.2. Bifurcation of von Kármán plates: basic results 213
4.3.3. Bifurcation points of the homogenized plate and the linearized problem 221
4.3.4. Bifurcating branches of perforated and homogenized plates 223

5. Moderately thick transversely symmetric plates 235
5.1. Reissner-Hencky model 235
5.2. The in-plane scaling-based asymptotic homogenization 236
5.3. The refined scaling analysis 239
5.4. Justification of the refined scaling approach 242
5.4.1. Basic relations and auxiliary results 243
5.4.2. Γ-convergence of the sequence $\{J_\varepsilon - L_\varepsilon\}_{\varepsilon>0}$ 247
5.5. Dual homogenization 254
5.6. Orthotropic plates periodic in one direction 261
5.6.1. Effective stiffnesses according to the in-plane scaling approach .. 262
5.6.2. Effective stiffnesses according to the refined scaling approach 263
5.6.3. Effective torsional stiffness of plates of step-wise varying thickness 266
5.6.4. Formula of Tartar-Francfort-Murat type for effective stiffnesses of ribbed plates. In-plane scaling approach 269
5.7. Other linear and nonlinear models of plates with moderate thickness. Homogenization study 270
5.7.1. Reissner's model 271
5.7.2. A refined theory of moderately thick plates undergoing moderately large deflections 275
5.7.3. Homogenization study 278

6. Sandwich plates with soft core 287
6.1. Hoff's theory 287
6.2. Effective stiffnesses in the periodic case 291
6.3. Reissner's approximation and relevant homogenization formulae 293

7. Comments and bibliographical notes 294

Chapter III. ELASTIC PLATES WITH CRACKS
Introduction 303

8. Unilateral cracks in thin plates 304
8.1. Cracking modes 304
8.2. Periodic layout of cracks. Homogenization 305
8.3. Justification: Γ-convergence 310

9. Unilateral cracks in plates with transverse shear deformation 315
9.1. Admissible cracking modes 315
9.2. Periodic layout of cracks. Homogenization 319
9.3. Justification: variational inequality (9.2.1) and the energy method 323

10. Part-through the thickness cracks 339
10.1. Two-layer description 339
10.2. In-plane scaling and effective model 345
10.3. The study of convergence 349

10.4. Dual homogenization 358
10.5. Passage to classical models of cracked plates 363
10.6. Refined scaling and effective model 364
10.7. Plates with aligned cracks 369
10.8. Cracks of arbitrary position. Three-dimensional local analysis 378
10.8.1. Asymptotic analysis 378
10.8.2. Justification by Γ-convergence 384

11. Stiffness loss of cracked laminates 388
11.1. Two-dimensional model of transversely symmetric laminates in stretching and in-plane shearing 388
11.2. Modelling the unilateral crack within the internal layer 394
11.3. Regular crack systems 396
11.4. Moderately thick laminate weakened by transverse cracks of high density. Model (h, l_0) 397
11.5. Thin laminate with transverse cracks of high density. Model (h_0, l_0) 401
11.6. Thin laminate weakened by transverse cracks of arbitrary density. Model (h_0, l) 403
11.7. Justification by Γ-convergence and duality 409
11.7.1. Moderately thick laminate 410
11.7.2. Refined scaling and Γ-convergence 411
11.8. Application of the augmented Lagrangian method to solving local problems with unilateral constraints 432
11.9. Case of aligned parallel intralaminar cracks. Effective characteristics according to the (h_0, l) approach 434
11.10. Degradation of effective stiffnesses of laminates with aligned parallel cracks. The refined scaling approach-model (h_0, l) 442
11.11. Degradation of effective stiffnesses of laminates $[0_n^\circ/90_m^\circ]_s$. Comparison with experimental results and with other analytical predictions 448
11.11.1. Scope of the section 448
11.11.2. $[0°/90_3^\circ]_s$ glass/epoxy laminate tested by Highsmith and Reifsnider (1982) 449
11.11.3. $[0°/90°]_s$ glass/epoxy laminate tested by Ogin et al. (1985) 455
11.11.4. $[0_m^\circ/90_n^\circ]_s$ graphite/epoxy laminates tested by Groves (1986) 455
11.11.5. $[0°/90°]_s$ glass/epoxy laminates tested by Smith and Wood (1990) 458
11.11.6. $[0°/90°]_s$ carbon/epoxy laminate tested by Smith and Wood (1990) 458
11.12. Stress distribution around crack tips 459
11.13. Crack spacing as a function of the averaged applied stress 462

12. Comments and bibliographical notes 464

Chapter IV. ELASTIC-PERFECTLY PLASTIC PLATES
Introduction 469

13. Mathematical complements, homogenization of functionals with linear growth 469
13.1. Functional setting: spaces $W^{1,1}$, $W^{2,1}$, LD, BV, BD, and HB 470
13.2. Convex functions and functionals of a measure 478
13.3. General homogenization theorems for functionals with linear growth 483
13.4. Γ-convergence and Dirichlet boundary conditions, relaxation 494
13.4.1. Thin Kirchhoff plates made of Hencky material 494
13.4.2. Moderately thick plates, refined scaling 496
13.4.3. On von Kármán plates made of Hencky material 497

14. Homogenization of plates loaded by forces and moments 498
14.1. Thin Kirchhoff plates loaded by boundary forces and moments 498
14.2. Three models of thin, transversely inhomogeneous and anisotropic plates with constant thickness 516
14.2.1. Basic relations 516
14.2.2. Derivation of the effective plate model by passing to zero: $e \to 0$ and next $\varepsilon \to 0$ 521
14.2.3. Derivation of the second effective plate model: $\varepsilon \to 0$ and next $e \to 0$ 529
14.2.4. Derivation of the third effective plate model: $e \to 0$ and $\varepsilon \to 0$ simultaneously 530

15. Comments and bibliographical notes 532

Chapter V. ELASTIC AND PLASTIC SHELLS
Introduction 535

16. Linear and nonlinear models of elastic shells 535
16.1. Theory of shells with transverse shear deformation 535
16.2. Koiter's version of thin shell model 541
16.3. Budiansky-Sanders-Koiter version of a thin shell model 545
16.4. Thin shell model with moderately large rotations around tangents 547
16.5. The models of Mushtari-Donnell-Vlasov and Mushtari-Marguerre 548

17. Homogenization of stiffnesses of thin periodic elastic shells. Linear approach 551
17.1. Koiter's shell. Asymptotic analysis and the convergence theorem 551
17.1.1. Asymptotic analysis 551
17.1.2. Justification by the Γ-convergence method 557
17.2. Dual homogenization 560
17.3. Effective stiffnesses of ribbed orthotropic cylindrical shells 567
17.3.1. Geometrical and material characteristics of a cylindrical shell 567
17.3.2. Strong formulations of the local problems (P_Y^α) 568

17.3.3. Case of stiffeners along the generating lines 568
17.3.4. Case of circumferential stiffening 569
17.4. Shallow shells of periodic structure: effective properties 572

18. Homogenized properties of thin periodic elastic shells undergoing moderately large rotations around tangents 574

19. Perfectly plastic shells 575

20. Comments and bibliographical notes 578

Chapter VI. APPLICATION OF HOMOGENIZATION METHODS IN OPTIMUM DESIGN OF PLATES AND SHELLS

Introduction 581

21. Mathematical complements 582
21.1. Alternative representation of second and fourth order tensors 582
21.2. Y-transformation 588
21.3. Fourier representation of Y-periodic functions 593
21.4. Examples of quasiconvex and quasiaffine functions 594
21.4.1. A quasiaffine function of the strain tensor κ 594
21.4.2. A quasiaffine function of two strain tensors 595
21.4.3. An aggregate form of the previous results 596
21.4.4. A quasiaffine function of the stress tensor m 596
21.4.5. A quasiaffine function of the stress tensor n 597
21.4.6. A quasiaffine function of two stress tensors 598
21.4.7. An aggregate form of the two previous results 598
21.5. Harmonic mean as a lower bound for effective energy 599
21.6. Elements of the theory of Young measures 599

22. Two-phase plate in bending. Hashin-Shtrikman bounds 606
22.1. Lower bound for the Kelvin modulus 606
22.2. Upper bound for the Kelvin modulus 608
22.3. Lower bound for the Kirchhoff modulus 609
22.4. Upper bound for the Kirchhoff modulus 611
22.5. Attainability of Hashin-Shtrikman bounds. The Francfort – Murat construction 612

23. Two-phase plate. Hashin-Shtrikman bounds for the in-plane problem 616
23.1. The upper and lower bounds for the Kelvin modulus 616
23.2. The upper and lower bounds for the Kirchhoff modulus 617
23.3. Attainability of Hashin-Shtrikman bounds 619
23.4. Summary of the main results 621

24. Explicit formulae for effective bending stiffnesses and compliances of ribbed plates ... 622
24.1. First rank ribbed structure ... 622
24.2. Second rank ribbed structure with soft phase taken as a core ... 624
24.3. Second rank ribbed structure with the strong phase taken as a core ... 629

25. Explicit formulae for effective membrane stiffnesses and compliances of ribbed plates ... 632
25.1. First rank ribbed plates ... 632
25.2. Second rank ribbed plates ... 633

26. Thin bending two-phase plates of minimum compliance ... 634
26.1. Ill-posedness of the initial formulation ... 634
26.2. Relaxation ... 637
26.3. Bounding the potential $\mathcal{W}^*$ by the translation method of Cherkaev-Gibianskii ... 641
26.4. Attainability of the translation bound ... 646
26.4.1. Regime (2): $\zeta_M \in [\zeta_2, \zeta_1]$ ... 646
26.4.2. Regime (3): $\zeta_M \leq \zeta_2$ ... 648
26.4.3. Regime (1): $\zeta_M \geq \zeta_1$ ... 649
26.5. Physical interpretation of the relaxed problem ... 651
26.6. Primal formulation of the relaxed problem ... 653
26.7. On the shape design ... 661
26.8. Square clamped plates of minimum compliance ... 666
26.9. Optimal perforated plates of small volume ... 669

27. Minimum compliance problem for thin plates of varying thickness: application of Young measures ... 671

28. Thin shells of minimum compliance ... 678
28.1. Setting of the problem ... 678
28.2. Relaxation ... 681
28.3. Primal formulation of the relaxed problem ... 682
28.4. On the in-plane minimum compliance problem of two-phase plates ... 684

29. Truss-like Michell continua ... 688
29.1. Structures of minimum weight. Discrete versus continuum formulations ... 688
29.2. Dual formulation ... 691
29.3. A symmetric cantilever problem ... 694

30. Comments and bibliographical notes ... 696

References ... 703

Index ... 733
