

# Lineability

## The Search for Linearity in Mathematics

By Richard M. Aron, Luis Bernal-Gonzalez, Daniel M. Pellegrino, Juan B. Seoane Sepulveda – ISBN 9781482299090

### Table of Contents

---

#### **Preliminary Notions and Tools**

Cardinal numbers

Cardinal arithmetic

Basic concepts and results of abstract and linear algebra

Residual subsets

Lineability, spaceability, algebrability, and their variants

#### **Real Analysis**

What one needs to know

Weierstrass' monsters

Differentiable nowhere monotone functions

Nowhere analytic functions and annulling functions

Surjections, Darboux functions, and related properties

Other properties related to the lack of continuity

Continuous functions that attain their maximum at only one point

Peano maps and space-filling curves

#### **Complex Analysis**

What one needs to know

Nonextendable holomorphic functions: genericity

Vector spaces of nonextendable functions

Nonextendability in the unit disc

Tamed entire functions

Wild behavior near the boundary

Nowhere Gevrey differentiability

#### **Sequence Spaces, Measure Theory, and Integration**

What one needs to know

Lineability and spaceability in sequence spaces

Non-contractive maps and spaceability in sequence spaces

Lineability and spaceability in  $L_p[0, 1]$

Spaceability in Lebesgue spaces

Lineability in sets of norm attaining operators in sequence spaces  
Riemann and Lebesgue integrable functions and spaceability

### **Universality, Hypercyclicity, and Chaos**

What one needs to know

Universal elements and hypercyclic vectors

Lineability and dense-lineability of families of hypercyclic vectors

Wild behavior near the boundary, universal series, and lineability

Hypercyclicity and spaceability

Algebras of hypercyclic vectors

Supercyclicity and lineability

Frequent hypercyclicity and lineability

Distributional chaos and lineability

### **Zeros of Polynomials in Banach Spaces**

What one needs to know

Zeros of polynomials: the results

### **Miscellaneous**

Series in classical Banach spaces

Dirichlet series

Non-convergent Fourier series

Norm-attaining functionals

Annulling functions and sequences with finitely many zeros

Sierpiński-Zygmund functions

Non-Lipschitz functions with bounded gradient

The Denjoy-Clarkson property

### **General Techniques**

What one needs to know

The negative side

When lineability implies dense-lineability

General results about spaceability

An algebrability criterion

Additivity and cardinal invariants: a brief account

### **Bibliography**

### **Index**
