Bibliographical Note

This Dover edition, first published in 2014, is an unabridged and unaltered republication in one volume of the English translation of *Mécanique Quantique*, first published in 1961-62. Volume I was translated from the French by G. H. Temmer, Volume II by J. Potter. The combined Index for both volumes has been placed at the end of this edition.

International Standard Book Number

ISBN-13: 978-0-486-78455-7

ISBN-10: 0-486-78455-X

CONTENTS

OF VOLUME I

PART ONE

THE FORMALISM AND ITS INTERPRETATION

CHAPTER I

THE ORIGINS OF THE QUANTUM THEORY

1. Introduction
- I. THE END OF THE CLASSICAL PERIOD
 2. Classical Theoretical Physics.
 3. Progress in the knowledge of microscopic phenomena and the appearance of quanta in physics.
- II. LIGHT QUANTA OR PHOTONS
 4. The photoelectric effect.
 5. The Compton effect.
 6. Light quanta and interference phenomena.
 7. Conclusions.
- III. QUANTIZATION OF MATERIAL SYSTEMS
 8. Atomic spectroscopy and difficulties of Rutherford's classical model.
 9. Quantization of atomic energy levels.
 10. Other examples of quantization: space quantization.
- IV. CORRESPONDENCE PRINCIPLE AND THE OLD QUANTUM THEORY.
 11. Inadequacy of classical corpuscular theory.
 12. Correspondence principle.
 13. Application of the correspondence principle to the calculation of the Rydberg constant.
 14. Lagrange's and Hamilton's forms of the equations of classical mechanics.
 15. Bohr-Sommerfeld quantization rules.
 16. Successes and limitations of the Old Quantum Theory.
 17. Conclusions.

CHAPTER II

MATTER WAVES AND THE SCHRÖDINGER EQUATION

1. Historical survey and general plan of the succeeding chapters
- I. MATTER WAVES
 2. Introduction.
 3. Free wave packet. Phase velocity and group velocity.
 4. Wave packet in a slowly varying field.
 5. Quantization of atomic energy levels.
 6. Diffraction of matter waves.
 7. Corpuscular structure of matter.
 8. Universal character of the wave-corpuscle duality.
- II. THE SCHRÖDINGER EQUATION
 9. Conservation law of the number of particles of matter.
 10. Necessity for a wave equation and conditions imposed upon this equation.
 11. The operator concept.
 12. Wave equation of a free particle.
 13. Particle in a scalar potential.
 14. Charged particle in an electromagnetic field.
 15. General rule for forming the Schrödinger equation by correspondence.
- III. THE TIME-INDEPENDENT SCHRÖDINGER EQUATION
 16. Search for stationary solutions.
 17. General properties of the equation. Nature of the energy spectrum.

CHAPTER III

ONE-DIMENSIONAL QUANTIZED SYSTEMS

1. Introduction
- I. SQUARE POTENTIALS
 2. General remarks.
 3. Potential step. Reflection and transmission of waves.
 4. Infinitely high potential barrier.
 5. Infinitely deep square potential well. Discrete spectrum.
 6. Study of a finite square well. Resonances.
 7. Penetration of a square potential barrier. The “tunnel” effect.
- II. GENERAL PROPERTIES OF THE ONE-DIMENSIONAL SCHRÖDINGER

EQUATION

8. Property of the Wronskian.
9. Asymptotic behavior of the solutions.
10. Nature of the eigenvalue spectrum.
11. Unbound states: reflection and transmission of waves.
12. Number of nodes of bound states.
13. Orthogonality relations.
14. Remark on parity.

CHAPTER IV

STATISTICAL INTERPRETATION OF THE WAVE-CORPUSCLE DUALITY AND THE UNCERTAINTY RELATIONS

1. Introduction
- I. STATISTICAL INTERPRETATION OF THE WAVE FUNCTIONS OF WAVE MECHANICS
 2. Probabilities of the results of measurement of the position and the momentum of a particle.
 3. Conservation in time of the norm.
 4. Concept of current.
 5. Mean values of functions of r or of p .
 6. Generalization to systems of several particles.
 - II. HEISENBERG'S UNCERTAINTY RELATIONS
 7. Position-momentum uncertainty relations of a quantized particle.
 8. Precise statement of the position-momentum uncertainty relations.
 9. Generalization: uncertainty relations between conjugate variables.
 10. Time-energy uncertainty relation.
 11. Uncertainty relations for photons.
 - III. UNCERTAINTY RELATIONS AND THE MEASUREMENT PROCESS
 12. Uncontrollable disturbance during the operation of measurement.
 13. Position measurements.
 14. Momentum measurements.
 - IV. DESCRIPTION OF PHENOMENA IN QUANTUM THEORY. COMPLEMENTARITY AND CAUSALITY
 15. Problems raised by the statistical interpretation.
 16. Description of microscopic phenomena and complementarity.
 17. Complementary variables. Compatible variables.

18. Wave-corpucle duality and complementarity.
19. Complementarity and causality.

CHAPTER V

DEVELOPMENT OF THE FORMALISM OF WAVE MECHANICS AND ITS INTERPRETATION

1. Introduction
- I. HERMITEAN OPERATORS AND PHYSICAL QUANTITIES
 2. Wave-function space.
 3. Definition of mean values.
 4. Absence of fluctuations and the eigenvalue problem.
- II. STUDY OF THE DISCRETE SPECTRUM
 5. Eigenvalues and eigenfunctions of a Hermitean operator.
 6. Expansion of a wave function in a series of orthonormal eigenfunctions.
 7. Statistical distribution of the results of measurement of a quantity associated with an operator having a complete set of eigenfunctions with finite norm.
- III. STATISTICS OF MEASUREMENT IN THE GENERAL CASE
 8. Difficulties of the continuous spectrum. Introduction of the Dirac δ -functions.
 9. Expansion in a series of eigenfunctions in the general case. Closure relation.
 10. Statistical distribution of the results of measurement in the general case.
 11. Other ways of treating the continuous spectrum.
 12. Comments and examples.
- IV. DETERMINATION OF THE WAVE FUNCTION
 13. Measuring process and “filtering” of the wave packet. Ideal measurements.
 14. Commuting observables and compatible variables.
 15. Complete sets of commuting observables.
 16. Pure states and mixtures.
- V. COMMUTATOR ALGEBRA AND ITS APPLICATIONS
 17. Commutator algebra and properties of basic commutators.
 18. Commutation relations of angular momentum.

19. Time dependence of the statistical distribution. Constants of the motion.
20. Examples of constants of the motion. Energy. Parity.

CHAPTER VI

CLASSICAL APPROXIMATION AND THE WKB METHOD

I. THE CLASSICAL LIMIT OF WAVE MECHANICS

1. General remarks.
2. Ehrenfest's theorem.
3. Motion and spreading of wave packets.
4. Classical limit of the Schrödinger equation.
5. Application to Coulomb scattering. The Rutherford formula.

II. THE WKB METHOD

6. Principle of the method.
7. One-dimensional WKB solutions.
8. Conditions for the validity of the WKB approximation.
9. Turning points and connection formulae.
10. Penetration of a potential barrier.
11. Energy levels of a potential well.

CHAPTER VII

GENERAL FORMALISM OF THE QUANTUM THEORY

(A) MATHEMATICAL FRAMEWORK

1. Superposition principle and representation of dynamical states by vectors

I. VECTORS AND OPERATORS

2. Vector space. "Ket" vectors.
3. Dual space. "Bra" vectors.
4. Scalar product.
5. Linear operators.
6. Tensor product of two vector spaces.

II. HERMITEAN OPERATORS, PROJECTORS, AND OBSERVABLES

7. Adjoint operators and conjugation relations.
8. Hermitean (or self-adjoint) operators, positive definite Hermitean operators, unitary operators.

9. Eigenvalue problem and observables.
10. Projectors (Projection operators).
11. Projector algebra.
12. Observables possessing an entirely discrete spectrum.
13. Observables in the general case. Generalized closure relation.
14. Functions of an observable.
15. Operators which commute with an observable. Commuting observables.

III. REPRESENTATION THEORY

16. General remarks on finite matrices.
17. Square matrices.
18. Extension to infinite matrices.
19. Representation of vectors and operators by matrices.
20. Matrix transformations.
21. Change of representation.
22. Unitary transformations of operators and vectors.

CHAPTER VIII

GENERAL FORMALISM

(B) DESCRIPTION OF PHYSICAL PHENOMENA

1. Introduction

I. DYNAMICAL STATES AND PHYSICAL QUANTITIES

2. Definition of probabilities. Postulates concerning measurement.
3. Observables of a quantized system and their commutation relations.
4. Heisenberg's uncertainty relations.
5. Definition of the dynamical states and construction of the space \mathcal{E} .
6. One-dimensional quantum system having a classical analogue.
7. Construction of the \mathcal{E} -space of a system by tensor product of simpler spaces.

II. THE EQUATIONS OF MOTION

8. Evolution operator and the Schrödinger equation.
9. Schrödinger "representation".
10. Heisenberg "representation".
11. Heisenberg "representation" and correspondence principle.
12. Constants of the motion.
13. Equations of motion for the mean values. Time-energy uncertainty relation.

- 14. Intermediate representations.
- III. VARIOUS REPRESENTATIONS OF THE THEORY
 - 15. Definition of a representation.
 - 16. Wave mechanics.
 - 17. Momentum representation ($\{p\}$ -representation).
 - 18. An example: motion of a free wave packet.
 - 19. Other representations. Representations in which the energy is diagonal.
- IV. QUANTUM STATISTICS
 - 20. Incompletely known systems and statistical mixtures.
 - 21. The density operator.
 - 22. Evolution in time of a statistical mixture.
 - 23. Characteristic properties of the density operator.
 - 24. Pure states.
 - 25. Classical and quantum statistics.

PART TWO

SIMPLE SYSTEMS

CHAPTER IX

SOLUTION OF THE SCHRÖDINGER EQUATION BY SEPARATION OF VARIABLES. CENTRAL POTENTIAL

- 1. Introduction
- I. PARTICLE IN A CENTRAL POTENTIAL. GENERAL TREATMENT
 - 2. Expression of the Hamiltonian in spherical polar coordinates.
 - 3. Separation of the angular variables. Spherical harmonics.
 - 4. The radial equation.
 - 5. Eigensolutions of the radial equation. Nature of the spectrum.
 - 6. Conclusions.
- II. CENTRAL SQUARE-WELL POTENTIAL. FREE PARTICLE
 - 7. Spherical Bessel functions.
 - 8. Free particle. Plane waves and free spherical waves.
 - 9. Expansion of a plane wave in spherical harmonics.
 - 10. Study of a spherical square well.
- III. TWO-BODY PROBLEMS. SEPARATION OF THE CENTER-OF-MASS MOTION
 - 11. Separation of the center-of-mass motion in classical mechanics.

12. Separation of the center-of-mass motion of a quantized two-particle system.
13. Extension to systems of more than two particles.

CHAPTER X

SCATTERING PROBLEMS CENTRAL POTENTIAL AND PHASE-SHIFT METHOD

1. Introduction
- I. CROSS SECTIONS AND SCATTERING AMPLITUDES
 2. Definition of cross sections.
 3. Stationary wave of scattering.
 4. Representation of the scattering phenomenon by a bundle of wave packets.
 5. Scattering of a wave packet by a potential.
 6. Calculation of cross sections.
 7. Collision of two particles. Laboratory system and center-of-mass system.
- II. SCATTERING BY A CENTRAL POTENTIAL. PHASE SHIFTS
 8. Decomposition into partial waves. Phase-shift method.
 9. Semi-classical representation of the collision. Impact parameters.
- III. POTENTIAL OF FINITE RANGE
 10. Relation between phase shift and logarithmic derivative.
 11. Behavior of the phase shift at low energies.
 12. Partial waves of higher order. Convergence of the series.
 13. Scattering by a hard sphere.
- IV. SCATTERING RESONANCES
 14. Scattering by a deep square well.
 15. Study of a scattering resonance. Metastable states.
 16. Observation of the lifetime of metastable states.
- V. VARIOUS FORMULAE AND PROPERTIES
 17. Integral representations of phase shifts.
 18. Dependence upon the potential. Sign of the phase shifts.
 19. The Born approximation.
 20. Effective range theory. The Bethe formula.

CHAPTER XI

THE COULOMB INTERACTION

1. Introduction
- I. THE HYDROGEN ATOM
 2. Schrödinger equation of the hydrogen atom.
 3. Order of magnitude of the binding energy of the ground state.
 4. Solution of the Schrödinger equation in spherical coordinates.
 5. Energy spectrum. Degeneracy.
 6. The eigenfunctions of the bound states.
- II. COULOMB SCATTERING
 7. The Coulomb scattering wave.
 8. The Rutherford formula.
 9. Decomposition into partial waves.
 10. Expansion of the wave ψ_c in spherical harmonics.
 11. Modifications of the Coulomb potential by a short-range interaction.

CHAPTER XII

THE HARMONIC OSCILLATOR

1. Introduction
- I. EIGENSTATES AND EIGENVECTORS OF THE HAMILTONIAN
 2. The eigenvalue problem.
 3. Introduction of the operators a , a^\dagger and N .
 4. Spectrum and basis of N .
 5. The $\{N\}$ representation.
 6. Creation and destruction operators.
 7. $\{Q\}$ representation. Hermite polynomials.
- II. APPLICATIONS AND VARIOUS PROPERTIES
 8. Generating function for the eigenfunctions $u_n(Q)$.
 9. Integration of the Heisenberg equations.
 10. Classical and quantized oscillator.
 11. Motion of the minimum wave packet and classical limit.
 12. Harmonic oscillators in thermodynamic equilibrium.
- III. ISOTROPIC HARMONIC OSCILLATORS IN SEVERAL DIMENSIONS

13. General treatment of the isotropic oscillator in p dimensions.
14. Two-dimensional isotropic oscillator.
15. Three-dimensional isotropic oscillator.

APPENDIX A. DISTRIBUTIONS, δ -“FUNCTION” AND FOURIER TRANSFORMATION

APPENDIX B. SPECIAL FUNCTIONS AND ASSOCIATED FORMULAE

CONTENTS

OF VOLUME II

PART THREE

SYMMETRIES AND INVARIANCE

CHAPTER XIII

ANGULAR MOMENTUM IN QUANTUM MECHANICS

1. Introduction
- I. EIGENVALUES AND EIGENFUNCTIONS OF ANGULAR MOMENTUM
 2. Definition of angular momentum.
 3. Characteristic algebraic relations.
 4. Spectrum of \mathbf{J}^2 and J_z .
 5. Eigenvectors of \mathbf{J}^2 and J_z . Construction of the invariant subspaces $\mathcal{E}^{(j)}$.
 6. Standard representation $\{\mathbf{J}^2, J_z\}$.
 7. Conclusion.
- II. ORBITAL ANGULAR MOMENTUM AND THE SPHERICAL HARMONICS
 8. The spectrum of l^2 and l_z .
 9. Definition and construction of the spherical harmonics.
- III. ANGULAR MOMENTUM AND ROTATIONS
 10. Definition of rotation. Euler angles.
 11. Rotation of a physical system. Rotation operator.
 12. Rotation of observables.
 13. Angular momentum and infinitesimal rotations.
 14. Construction of the operator $R(\alpha, \beta, \gamma)$.

15. Rotation through an angle 2π and half-integral angular momenta.
16. Irreducible invariant subspaces. Rotation matrices $R^{(j)}$.
17. Rotational invariance and conservation of angular momentum. Rotational degeneracy.

IV. SPIN

18. The hypothesis of electron spin.
19. Spin $\frac{1}{2}$ and the Pauli matrices.
20. Observables and wave functions of a spin $\frac{1}{2}$ particle. Spinor fields.
21. Vector fields and particles of spin 1.
22. Spin-dependent interactions in atoms.
23. Spin-dependent nucleon-nucleon interactions.

V. ADDITION OF ANGULAR MOMENTA

24. The addition problem.
25. Addition theorem for two angular momenta.
26. Applications and examples.
27. Eigenvectors of the total angular momentum. Clebsch-Gordon coefficients.
28. Application: two-nucleon system.
29. Addition of three or more angular momenta. Racah coefficients. "3j" symbols.

VI. IRREDUCIBLE TENSOR OPERATORS

30. Representation of scalar operators.
31. Irreducible tensor operators. Definition.
32. Representation of irreducible tensor operators. Wigner-Eckhart theorem.
33. Applications.

CHAPTER XIV

SYSTEMS OF IDENTICAL PARTICLES. PAULI EXCLUSION PRINCIPLE

1. Identical particles in quantum theory

I. SYMMETRIZATION POSTULATE

2. Similar particles and the symmetrical representation.
3. Permutation operators.
4. Algebra of permutation operators. Symmetrizers and antisymmetrizers.

5. Identical particles and the symmetrization postulate.
6. Bosons and Bose–Einstein statistics.
7. Fermions and Fermi–Dirac statistics. Exclusion principle.
8. It is always necessary to symmetrize the wave-function.

II. APPLICATIONS

9. Collision of two spinless identical particles.
10. Collision of two protons.
11. Statistics of atomic nuclei.
12. Complex atoms. Central field approximation.
13. The Thomas-Fermi model of the atom.
14. Nucleon systems and isotopic spin.
15. Utility of isotopic spin. Charge independence.

CHAPTER XV

INVARIANCE AND CONSERVATION THEOREMS. TIME REVERSAL

1. Introduction

I. MATHEMATICAL COMPLEMENTS. ANTILINEAR OPERATORS

2. Three useful theorems.
3. Antilinear operators in Hilbert space.
4. Antilinear transformations.
5. Antilinear operators and representations.

II. TRANSFORMATIONS AND GROUPS OF TRANSFORMATIONS

6. Transformations of the dynamical variables and dynamical states of a system.
7. Groups of transformations.
8. Groups of transformation operators.
9. Continuous groups and infinitesimal transformations. Translations. Rotations.
10. Finite groups. Reflections.

III. INVARIANCE OF THE EQUATIONS OF MOTION AND CONSERVATION LAWS

11. Invariant observables.
12. Symmetry of the Hamiltonian and conservation laws.
13. Invariance properties and the evolution of dynamical states.
14. Symmetries of the Stark and Zeeman effects.

IV. TIME REVERSAL AND THE PRINCIPLE OF MICROREVERSIBILITY

15. Time translation and conservation of energy.

16. Time reversal in classical mechanics and in quantum mechanics.
17. The time-reversal operation. Spinless particle.
18. General definition of time reversal.
19. Time reversal and complex conjugation.
20. Principle of microreversibility.
21. Consequence: Kramers degeneracy.
22. Real rotation-invariant Hamiltonian.

PART FOUR

METHODS OF APPROXIMATION

CHAPTER XVI

STATIONARY PERTURBATIONS

1. General introduction to Part Four
- I. PERTURBATION OF A NON-DEGENERATE LEVEL
 2. Expansion in powers of the perturbation.
 3. First-order perturbations.
 4. Ground state of the helium atom.
 5. Coulomb energy of atomic nuclei.
 6. Higher-order corrections.
 7. Stark effect for a rigid rotator.
- II. PERTURBATION OF A DEGENERATE LEVEL
 8. Elementary theory.
 9. Atomic levels in the absence of spin-orbit forces.
 10. Spin-orbit forces. LS and jj coupling.
 11. The atom in LS coupling. Splitting due to spin-orbital coupling.
 12. The Zeeman and Paschen–Back effects.
 13. Symmetry of H and removal of degeneracy.
 14. Quasi-degeneracy.
- III. EXPLICIT FORMS FOR THE PERTURBATION EXPANSION IN ALL ORDERS
 15. The Hamiltonian H and its resolvent $G(z)$.
 16. Expansion of $G(z)$, P and HP into power series in V .
 17. Calculation of eigenvalues and eigenstates.

CHAPTER XVII

APPROXIMATE SOLUTIONS OF THE TIME-DEPENDENT

SCHRÖDINGER EQUATION

1. Change of “representation” and perturbation treatment of a part of the Hamiltonian
- I. TIME DEPENDENT PERTURBATION THEORY
 2. Definition and perturbation calculation of transition probabilities.
 3. Semi-classical theory of Coulomb excitation of nuclei.
 4. Case when V is independent of time. Conservation of unperturbed energy.
 5. Application to the calculation of cross-sections in the Born approximation.
 6. Periodic perturbation. Resonances.
 - II. SUDDEN OR ADIABATIC CHANGE OF THE HAMILTONIAN
 7. The problem and the results.
 8. Rapid passage and the sudden approximation.
 9. Sudden reversal of a magnetic field.
 10. Adiabatic passage. Generalities. Trivial case.
 11. “Rotating axis representation”.
 12. Proof of the adiabatic theorem.
 13. Adiabatic approximation.
 14. Adiabatic reversal of a magnetic field.

CHAPTER XVIII

THE VARIATIONAL METHOD AND ASSOCIATED PROBLEMS

1. The Ritz variational method
- I. VARIATIONAL METHOD FOR BOUND STATES
 2. Variational form of the eigenvalue problem.
 3. Variational calculation of discrete levels.
 4. A simple example: the hydrogen atom.
 5. Discussion. Application to the calculation of excited levels.
 6. Ground state of the helium atom.
 - II. THE HARTREE AND FOCK–DIRAC ATOMS
 7. The self-consistent field method.
 8. Calculation of $E[\Phi]$.
 9. The Fock–Dirac equations.
 10. Discussion.

11. The Hartree equations.
- III. THE STRUCTURE OF MOLECULES
12. Generalities. Separation of the electronic and nuclear motions.
 13. Motion of the electrons in the presence of fixed nuclei.
 14. The adiabatic approximation.
 15. Hamiltonian for the nuclei in the adiabatic approximation.
 16. The Born-Oppenheimer method.
 17. Notions on diatomic molecules.

CHAPTER XIX

COLLISION THEORY

1. Introduction
- I. FREE WAVE GREEN'S FUNCTION AND THE BORN APPROXIMATION
2. Integral representations of the scattering amplitude.
 3. Cross sections and the T matrix. Microreversibility.
 4. The Born approximation.
 5. Integral equation for scattering.
 6. The Born expansion.
 7. Validity criterion for the Born approximation.
 8. Elastic scattering of electrons by an atom.
 9. Central potential. Calculation of phase shifts.
 10. Green's function as an operator. Relation to the resolvent of H_0 .
- II. GENERALIZATION TO DISTORTED WAVES
11. Generalized Born approximation.
 12. Generalization of the Born expansion.
 13. Green's functions for distorted waves.
 14. Applications. Definition and formal properties of T .
 15. Note on the $1/r$ potentials.
- III. COMPLEX COLLISIONS AND THE BORN APPROXIMATION
16. Generalities. Cross sections.
 17. Channels.
 18. Calculation of cross sections. T matrices.
 19. Integral representations of the transition amplitude.
 20. The Born approximation and its generalizations.
 21. Scattering of fast electrons by an atom.
 22. Coulomb excitation of nuclei.

23. Green's functions and integral equations for stationary scattering waves.
 24. Scattering of a particle by two scattering centers.
 25. Simple scattering. Interference.
 26. Multiple scattering.
- IV. VARIATIONAL CALCULATIONS OF TRANSITION AMPLITUDES
27. Stationary expressions for the phase shifts.
 28. The variational calculation of phase shifts. Discussion.
 29. Extension to complex collisions.
- V. GENERAL PROPERTIES OF THE TRANSITION MATRIX
30. Conservation of flux. Unitarity of the S matrix.
 31. The Bohr–Peierls–Placzek relation (optical theorem).
 32. Microreversibility.
 33. Invariance properties of the T matrix.

PART FIVE

ELEMENTS OF RELATIVISTIC QUANTUM MECHANICS

CHAPTER XX

THE DIRAC EQUATION

- I. GENERAL INTRODUCTION
1. Relativistic quantum mechanics.
 2. Notation, various conventions and definitions.
 3. The Lorentz group.
 4. Classical relativistic dynamics.
- II. THE DIRAC AND KLEIN–GORDON EQUATIONS
5. The Klein-Gordon equation.
 6. The Dirac equation.
 7. Construction of the space $\mathcal{E}(\mathfrak{s})$. Dirac representation.
 8. Covariant form of the Dirac equation.
 9. Adjoint equation. Definition of the current.
- III. INVARIANCE PROPERTIES OF THE DIRAC EQUATION
10. Properties of the Dirac matrices.
 11. Invariance of the form of the Dirac equation in an orthochronous change of referential.
 12. Transformation of the proper group.

13. Spatial reflection and the orthochronous group.
 14. Construction of covariant quantities.
 15. A second formulation of the invariance of form: transformation of states.
 16. Invariance of the law of motion.
 17. Transformation operators. Momentum, angular momentum, parity.
 18. Conservation laws and constants of the motion.
 19. Time reversal and charge conjugation.
 20. Gauge invariance.
- IV. INTERPRETATION OF THE OPERATORS AND SIMPLE SOLUTIONS
21. The Dirac equation and the correspondence principle.
 22. Dynamical variables of a Dirac particle.
 23. The free electron. Plane waves.
 24. Construction of the plane waves by a Lorentz transformation.
 25. Central potential.
 26. Free spherical waves.
 27. The hydrogen atom.
- V. NON-RELATIVISTIC LIMIT OF THE DIRAC EQUATION
28. Large and small components.
 29. The Pauli theory as the non-relativistic limit of the Dirac theory.
 30. Application: hyperfine structure and dipole-dipole coupling.
 31. Higher-order corrections and the Foldy–Wouthuysen transformation.
 32. FW transformation for a free particle.
 33. FW transformation for a particle in a field.
 34. Electron in a central electrostatic potential.
 35. Discussions and conclusions.
- VI. NEGATIVE ENERGY SOLUTIONS AND POSITRON THEORY
36. Properties of charge conjugate solutions.
 37. Abnormal behavior of the negative energy solutions.
 38. Reinterpretation of the negative energy states. Theory of “holes” and positrons.
 39. Difficulties with the “hole” theory.

CHAPTER XXI

FIELD QUANTIZATION. RADIATION THEORY

1. Introduction

- I. QUANTIZATION OF A REAL SCALAR FIELD
 2. Classical free field. Normal vibrations.
 3. Quantization of the free field.
 4. Lagrangian of the field. Momentum conjugate to $\Phi(r)$.
 5. Complex basis functions.
 6. Plane waves. Definition of the momentum.
 7. Spherical waves. Definition of the angular momentum.
 8. Space and time reflections.

- II. COUPLING WITH AN ATOMIC SYSTEM
 9. Coupling to a system of particles.
 10. Weak coupling and perturbation treatment.
 11. Level shifts.
 12. Emission of a corpuscle.
 13. Quantum theory of decaying states. Line width.
 14. Elastic scattering. Dispersion formula.
 15. Resonance scattering. Formation of a metastable state.
 16. Absorption of a corpuscle (photo-electric effect). Radiative capture.

- III. CLASSICAL THEORY OF ELECTROMAGNETIC RADIATION
 17. The equations of the classical Maxwell-Lorentz theory.
 18. Symmetries and conservation laws of the classical theory.
 19. Self-energy and classical radius of the electron.
 20. Electromagnetic potential. Choice of the gauge.
 21. Longitudinal and transverse parts of a vector field.
 22. Elimination of the longitudinal field.
 23. Energy, momentum, angular momentum.
 24. Hamiltonian for free radiation.
 25. Hamiltonian for radiation coupled to a set of particles.

- IV. QUANTUM THEORY OF RADIATION
 26. Quantization of free radiation. Photons.
 27. Plane waves. Radiation momentum.
 28. Polarization.
 29. Multipole expansion. Photons of determined angular momentum and parity.
 30. Coupling with an atomic system.
 31. Emission of a photon by an atom. Dipole emission.
 32. Low energy Compton scattering. The Thomson formula.

APPENDIX C. VECTOR ADDITION COEFFICIENTS AND ROTATION MATRICES

APPENDIX D. ELEMENTS OF GROUP THEORY

GENERAL INDEX
