# Contents

**Preface** **ix**

**Symbols and Acronyms** **xiii**

**1 The Linear Data Fitting Problem** **1**
1.1 Parameter estimation, data approximation 1
1.2 Formulation of the data fitting problem 4
1.3 Maximum likelihood estimation 9
1.4 The residuals and their properties 13
1.5 Robust regression 19

**2 The Linear Least Squares Problem** **25**
2.1 Linear least squares problem formulation 25
2.2 The QR factorization and its role 33
2.3 Permuted QR factorization 39

**3 Analysis of Least Squares Problems** **47**
3.1 The pseudoinverse 47
3.2 The singular value decomposition 50
3.3 Generalized singular value decomposition 54
3.4 Condition number and column scaling 55
3.5 Perturbation analysis 58

**4 Direct Methods for Full-Rank Problems** **65**
4.1 Normal equations 65
4.2 LU factorization 68
4.3 QR factorization 70
4.4 Modifying least squares problems 80
4.5 Iterative refinement 85
4.6 Stability and condition number estimation 88
4.7 Comparison of the methods 89

Materiale protetto da copyright

**5 Direct Methods for Rank-Deficient Problems** **91**
5.1 Numerical rank 92
5.2 Peters-Wilkinson LU factorization 93
5.3 QR factorization with column permutations 94
5.4 UTV and VSV decompositions 98
5.5 Bidiagonalization 99
5.6 SVD computations 101

**6 Methods for Large-Scale Problems** **105**
6.1 Iterative versus direct methods 105
6.2 Classical stationary methods 107
6.3 Non-stationary methods, Krylov methods 108
6.4 Practicalities: preconditioning and stopping criteria 114
6.5 Block methods 117

**7 Additional Topics in Least Squares** **121**
7.1 Constrained linear least squares problems 121
7.2 Missing data problems 131
7.3 Total least squares (TLS) 136
7.4 Convex optimization 143
7.5 Compressed sensing 144

**8 Nonlinear Least Squares Problems** **147**
8.1 Introduction 147
8.2 Unconstrained problems 150
8.3 Optimality conditions for constrained problems 156
8.4 Separable nonlinear least squares problems 158
8.5 Multiobjective optimization 160

**9 Algorithms for Solving Nonlinear LSQ Problems** **163**
9.1 Newton's method 164
9.2 The Gauss-Newton method 166
9.3 The Levenberg-Marquardt method 170
9.4 Additional considerations and software 176
9.5 Iteratively reweighted LSQ algorithms for robust data fitting problems 178
9.6 Variable projection algorithm 181
9.7 Block methods for large-scale problems 185

**10 Ill-Conditioned Problems** **191**
10.1 Characterization 191
10.2 Regularization methods 192
10.3 Parameter selection techniques 195
10.4 Extensions of Tikhonov regularization 198
10.5 Ill-conditioned NLLSQ problems 201

**11 Linear Least Squares Applications** **203**
11.1 Splines in approximation 203
11.2 Global temperatures data fitting 212
11.3 Geological surface modeling 221

**12 Nonlinear Least Squares Applications** **231**
12.1 Neural networks training 231
12.2 Response surfaces, surrogates or proxies 238
12.3 Optimal design of a supersonic aircraft 241
12.4 NMR spectroscopy 248
12.5 Piezoelectric crystal identification 251
12.6 Travel time inversion of seismic data 258

**Appendices** **262**

**A Sensitivity Analysis** **263**
A.1 Floating-point arithmetic 263
A.2 Stability, conditioning and accuracy 264

**B Linear Algebra Background** **267**
B.1 Norms 267
B.2 Condition number 268
B.3 Orthogonality 269
B.4 Some additional matrix properties 270

**C Advanced Calculus Background** **271**
C.1 Convergence rates 271
C.2 Multivariable calculus 272

**D Statistics** **275**
D.1 Definitions 275
D.2 Hypothesis testing 280

**References** **281**

**Index** **301**
