Contents

Preface	ix
1 From differential equations to structured population dynamics	1
1.1 Invasions and space structure	2
1.2 Ecology and Lotka–Volterra type of systems	3
1.2.1 The 2×2 Lotka–Volterra system	3
1.2.2 Rosensweig–MacArthur	6
1.2.3 Chemostat (1); several nutrients	7
1.3 Hodgkin–Huxley, Fitzhugh–Nagumo and pulse propagation	10
1.3.1 Van der Pol equation and auto-oscillations	11
1.3.2 Slow-fast dynamics and electric pulses	12
1.3.3 Fitzhugh–Nagumo and concentration pulses	13
1.3.4 Fitzhugh–Nagumo system with space structure	14
1.4 Virus dynamics and the immune system	15
1.4.1 Virus dynamics, immune response	15
1.4.2 Virulence structure	15
1.5 Models of epidemiology	16
1.5.1 Discrete states; SI, SIR, SEIR	16
1.5.2 The Kermack–McKendrick model	18
1.5.3 An immunity structured model	18
1.6 Ecological model of competition for resources	19
1.6.1 Chemostat (2): several micro-organisms	19
1.6.2 Continuous model of a chemostat	22
1.7 Phytoplankton (light structure)	23
2 Adaptive dynamics; an asymptotic point of view	27
2.1 Structured population and selection principle: a simple case	28
2.2 Structured population and selection principle: an extension	31
2.3 Structured population: cannibalism	34
2.4 Mutations	36
2.5 Small mutations: the constrained Hamilton–Jacobi equation	40
2.6 A simple case of constrained Hamilton–Jacobi equation	43

2.7	A partial canonical equation and dynamics of the dominant trait	44
2.7.1	Derivation of a canonical equation	44
2.7.2	Monomorphic adaptive evolution	46
2.7.3	Dimorphic adaptive evolution	46
2.7.4	Adaptive evolution: cannibalism	48
2.7.5	Adaptive evolution: chemostat with two nutrients	48
2.8	A rigorous derivation of the Hamilton–Jacobi equation	49
2.9	Numerical results and examples of adaptive evolution	51
3	Population balance equations: the renewal equation	55
3.1	The renewal equation	56
3.2	Eigenelements	56
3.3	Existence theory	59
3.4	Regularity of solutions	62
3.5	Generalized relative entropy	63
3.6	Long time asymptotic: entropy method	64
3.7	Long time asymptotic: exponential decay	66
3.8	Extension: death rates	68
3.9	More realistic models around the renewal equation	69
3.9.1	Renewal equation for cell division cycle (one phase)	69
3.9.2	Cell division cycle: numerical results	71
3.9.3	A renewal system with quiescent/proliferative cells	72
3.9.4	The renewal equation with diffusion	73
3.9.5	A system of renewal equations for cell division cycle	75
3.9.6	Maturation structure	77
3.9.7	Stem cells and hematopoiesis	77
3.9.8	Model for ovulatory process	78
3.9.9	Exercises	79
4	Population balance equations: size structure	81
4.1	Equal mitosis	82
4.1.1	An example: B constant	83
4.1.2	A counterexample: size condition on B	85
4.1.3	The conservation law and generalized relative entropy	86
4.1.4	Exponential time decay to Stable Size Distribution	87
4.2	Size structured model for asymmetric cell division	89
4.2.1	Existence, regularity and comparison principle	90
4.2.2	Generalized relative entropy (1)	92
4.2.3	Eigenelements	93
4.2.4	Trend to a Stable Size Distribution	98
4.2.5	Some extensions and exercises	100
4.3	Population balance equations: other examples, nonlinear examples	101
4.3.1	Daphnia (size structured models with finite resource)	102
4.3.2	Balance law for cell division with finite resources	103

4.3.3	A model for internet TCP connections	104
4.3.4	Huxley’s model and actin-myosin interaction	104
4.3.5	Molecular motors	106
4.3.6	Conventional kinesin	107
5	Cell motion and chemotaxis	111
5.1	How do cells move	111
5.2	Chemotaxis: the Keller–Segel system ($d \geq 2$)	113
5.2.1	Free energy	115
5.2.2	Existence for small $L^{d/2}$ norm ($d > 2$)	116
5.2.3	Blow-up for large initial data ($d > 2$)	119
5.3	Critical mass in dimension 2	121
5.3.1	Proof of blow-up, concept of weak solution	122
5.3.2	Existence proof	125
5.4	Keller–Segel system: radially symmetric solutions	126
5.4.1	Reduced system with radial symmetry	127
5.4.2	Stationary states	128
5.4.3	Refined existence and blow-up	129
5.5	Related chemotactic and angiogenetic systems	131
5.5.1	Quorum sensing, volume filling, signal limiting	131
5.5.2	Reacting chemoattractant	132
5.5.3	Extra-cellular chemoattractant and active receptors	133
5.5.4	The log interaction kernel and Modified Keller–Segel	133
5.5.5	Some numerical results	134
5.5.6	A model from angiogenesis	135
5.6	Chemotaxis: kinetic equation	136
5.6.1	Nonlinear transport-scattering equation	136
5.6.2	Existence theory	138
5.7	Diffusion limit; back to the Keller–Segel equation	142
5.7.1	Rescaled kinetic chemotaxis model	143
5.7.2	Uniform estimate	144
5.7.3	Limit as ε vanishes	145
5.8	Hydrodynamic limit	147
6	General mathematical tools	151
6.1	Transport equations and the method of characteristics	151
6.1.1	Transport equation (strong form)	151
6.1.2	Transport equation (conservative form)	154
6.2	Transport equation (the DiPerna–Lions theory)	156
6.2.1	A regularization Lemma	157
6.2.2	Proof of Theorem 6.4	158
6.3	Generalized relative entropy: finite dimensional systems	159
6.3.1	The Perron–Frobenius theorem	159
6.3.2	The Floquet theory	163

6.4	Generalized relative entropy: parabolic and integral PDEs	165
6.4.1	Coefficients independent of time	165
6.4.2	Time dependent coefficients	168
6.4.3	Scattering equations	168
6.5	BV functions, Sobolev imbeddings	171
6.5.1	BV space; limits	171
6.5.2	Sobolev inequalities	172
6.5.3	Logarithmic inequalities	172
6.6	The Krein–Rutman theorem	175
6.6.1	Krein–Rutman theorem	175
6.6.2	Application to cell division equation	176
	Bibliography	179
	Index	195
