# A Brief Guide to Algebraic Number Theory

H. P. F. Swinnerton-Dyer  
University of Cambridge

---

# Contents

<i>Preface</i>	<i>page</i>	vii
<b>1 Numbers and Ideals</b>		1
1 The ring of integers		1
2 Ideals and factorization		9
3 Embedding in the complex numbers		18
4 Change of fields		23
5 Normal extensions		26
<b>2 Valuations</b>		31
6 Valuations and completions		31
7 Field extensions and ramification		40
8 The Different		43
9 Idèles and Adèles		48
<b>3 Special fields</b>		55
10 Quadratic fields		55
11 Pure cubic fields		62
12 Biquadratic fields		63
13 Cyclotomic fields		65
13.1 Class numbers of cyclotomic fields		68
13.2 Fermat's Last Theorem		73
<b>4 Analytic methods</b>		79
14 Zeta functions and $L$ -series		79
15 Analytic continuation and the functional equation		84
16 Density theorems		94
<b>5 Class Field Theory</b>		98
17 The classical theory		98
18 Chevalley's reformulation		103

19	Reciprocity theorems	106
20	The Kronecker-Weber Theorem	112
<i>Appendix</i>		117
A1	Prerequisites	117
. A1.1	Finitely generated abelian groups and lattices	117
A1.2	Norms and Traces	121
A1.3	Haar measure	122
A2	Additional topics	124
A2.1	Characters and duality	125
A2.2	Fourier transforms	128
A2.3	Galois theory for infinite extensions	132
<i>Exercises</i>		135
<i>Suggested further reading</i>		143
<i>Index</i>		145
