Library of Congress Catalog Card Number: 96-70577

Printed on permanent acid-free text paper, manufactured in accordance with ANSI/NISO Z39.48-1992 and ANSI/NISO Z39.48-1984 (Permanence of Paper).

Contents

<i>Preface</i>	xi	2.2.5 Mohr's circle of stress	48
<i>General symbols</i>	xiii	2.2.6 Mohr's circle of strain	50
1 Origins and classification of soils	1	2.3 Soil strength	51
1.1 Introduction: what is soil mechanics?	1	2.4 Friction	52
1.2 The structure of the Earth	3	2.5 The shearbox or direct shear apparatus	53
1.3 The origin of soils	4	2.6 Presentation of shearbox test data in engineering units	55
1.3.1 Transport processes and depositional environments	5	2.7 Volume changes during shear	55
1.4 Soil mineralogy	7	2.8 Critical states	57
1.4.1 Composition of soils	7	2.9 Peak strengths and dilatancy	59
1.4.2 The clay minerals	8	2.10 Shearbox tests on clays	63
1.4.3 Non-clay minerals	10	2.11 Applications	66
1.4.4 Surface forces	10	2.12 Stress states in the shearbox test	68
1.4.5 Organic (non-mineral) soils	11	2.12.1 Conventional interpretation	68
1.5 Phase relationships for soils	11	2.12.2 Alternative interpretation	69
1.6 Unit weight	13	2.12.3 Undrained tests on clays	70
1.6.1 Measuring the grain specific gravity G_s	15	2.13 The simple shear apparatus	71
1.7 Effective stress	17	Key points	76
1.7.1 Calculating vertical stresses in the ground	17	Questions	77
1.8 Particle size distributions	19	References	79
1.9 Soil filters	24	3 Groundwater, permeability and seepage	81
1.10 Soil description	27	3.1 Introduction and objectives	81
1.11 Index tests and classification of clay soils	29	3.2 Pore water pressures in the ground	82
1.12 Compaction	30	3.2.1 Artesian conditions and underdrainage	82
1.13 Houses built on clay	35	3.2.2 Effect of construction activities	83
1.14 Site investigation	38	3.2.3 Pore water pressures above the water table	84
Key points	42	3.3 Darcy's Law and soil permeability	85
Questions	42	3.4 Laboratory measurement of permeability	87
References	44	3.4.1 The constant head permeameter	87
		3.4.2 The falling head permeameter	89
2 Soil strength	46	3.5 Field measurement of permeability	91
2.1 Introduction and objectives	46	3.5.1 Well pumping test in an ideal confined aquifer	91
2.2 Stress analysis	47	3.5.2 Well pumping test in an ideal unconfined aquifer	92
2.2.1 General three-dimensional states of stress	47	3.6 Permeability of laminated soils	93
2.2.2 Principal stresses	47	3.7 Mathematics of groundwater flow	95
2.2.3 Plane strain	47	3.8 Plane flow	96
2.2.4 Axisymmetry	48		

3.9	Confined flownets	96	4.10	Limitations of the simple models for the behaviour of soils in one-dimensional compression and consolidation	158
3.10	Calculation of pore water pressures using flownets	103	4.10.1	Model for one-dimensional compression and swelling: specific volume against $\ln \sigma'_v$	158
3.11	Quicksand	104	4.10.2	One-dimensional consolidation solutions	159
3.12	Unconfined flownets	105	4.10.3	Horizontal stresses in one-dimensional compression and swelling	159
3.13	Distance of influence	107		Key points	160
3.14	Soils with anisotropic permeability	107		Questions	161
3.15	Zones of different permeability	109		References	164
3.16	Boundary conditions for flow into drains	110			
3.17	Application of well pumping formulae to construction dewatering	112			
3.18	Numerical methods	113			
3.19	Wells and pumping methods	116			
	3.19.1 Wellpoints	116			
	3.19.2 Deep wells	116			
	3.19.3 Ejectors	117			
	3.19.4 Well design	118			
	Key points	118			
	Questions	119			
	References	122			
4	One-dimensional compression and consolidation	124	5	The triaxial test and soil behaviour	165
4.1	Introduction and objectives	124	5.1	Objectives	165
4.2	One-dimensional compression: the oedometer test	125	5.2	The triaxial test	166
4.3	One-dimensional consolidation	132		5.2.1 Apparatus	166
4.4	Properties of isochrones	133		5.2.2 Procedures	166
4.5	One-dimensional consolidation: solution using parabolic isochrones	134		5.3 Stress parameters	168
4.6	Determining the consolidation coefficient c_v from oedometer test data	136		5.3.1 Stress invariants	168
4.7	Application of consolidation testing and theory to field problems	138		5.3.2 Notation	169
	4.7.1 Consolidation due to an increase in effective stress following ground-water lowering	138		5.4 Stress analysis of the triaxial test	169
	4.7.2 Underdrainage of a compressible layer	141		5.4.1 Assumptions	169
	4.7.3 Case study 4.2: vertical compression due to plane horizontal flow	146		5.4.2 Measured quantities	170
	4.7.4 Self weight consolidation: hydraulic fill	149		5.4.3 Converting measurements to stress, strain and state parameters	170
4.8	One-dimensional consolidation: exact solutions	151		5.4.4 Mohr circles of stress	171
	4.8.1 Derivation of differential equation governing one dimensional consolidation	151		5.4.5 Mohr circles of strain	171
	4.8.2 General solution to the consolidation equation	152		5.4.6 Other ways of presenting shear test data	172
	4.8.3 Solutions for particular boundary conditions using Fourier series	152			
4.9	Radial drainage	157		5.5 Isotropic compression and swelling	174
				5.6 Sample preparation by one-dimensional compression and swelling: K_0 consolidation	174
				5.7 Conditions imposed in shear tests	175
				5.8 Critical states	176
				5.8.1 Relation between M and ϕ'_{crit}	177
				5.9 Yield	177
				5.10 State paths during shear: normally consolidated and lightly overconsolidated clays	181
				5.10.1 Drained tests	181
				5.10.2 Undrained tests	182
				5.11 Peak strengths	189
				5.11.1 Predictions using Cam clay	189
				5.11.2 Hvorslev rupture and tensile fracture	190
				5.11.3 Interpreting peak strength data	191
				5.12 Undrained shear strengths	195
				5.13 Residual strength	197
				5.14 Sensitive soils	198

5.15	Correlation of critical state parameters with index tests	199		bound) solutions for a propped embedded cantilever retaining wall	243
5.16	Creep	200	7.6.1	$(\tau/\sigma')_{max} = \tan \phi'$ failure criterion	243
5.17	Anisotropy	201	7.6.2	$\tau_{max} = \tau_u$ failure criterion	247
5.18	Partly saturated soils	202	7.7	Mechanism-based (upper bound) solutions for gravity retaining walls	250
5.19	The critical state model applied to sands	203		7.7.1 Short-term case: $\tau_{max} = \tau_u$ failure criterion	253
5.20	New models	203		7.7.2 Long-term case: $(\tau/\sigma')_{max} = \tan \phi'$ failure criterion	261
	Key points	205	7.8	Limit equilibrium stress distributions for embedded retaining walls	269
	Questions	206		7.8.1 Long-term pore water pressures	269
	References	208		7.8.2 Unpropped embedded walls: fixed earth support conditions	269
6	Calculation of soil settlements using elasticity methods	211		7.8.3 Embedded walls propped at the crest: free and fixed earth support conditions	270
6.1	Introduction	211	7.9	Soil/wall friction	271
6.2	Selection of elastic parameters	212	7.10	Earth pressure coefficients taking account of shear stresses at the soil/wall interface	272
	6.2.1 Approximations and shortcomings of a simple elastic model	212		7.10.1 Effects of soil/wall friction	272
	6.2.2 Relationships between elastic constants	214		7.10.2 Effects of soil/wall adhesion	274
	6.2.3 Determining elastic moduli from triaxial compression test data	214		Key points	275
6.3	Boussinesq's solution	215		Questions	276
6.4	Estimation of increases in vertical stress at any depth due to any pattern of surface load, using Newmark's chart	216		References	279
6.5	Estimation of settlements due to surface loads and foundations	219			
6.6	Influence factors for stresses	223	8	Foundations and slopes	281
6.7	Standard solutions for surface settlements on an isotropic, homogeneous, elastic half-space	227	8.1	Introduction and objectives	281
6.8	Estimation of immediate settlements	227	8.2	Shallow strip foundations (footings): simple lower bounds	281
6.9	Effect of heterogeneity	228		8.2.1 Effective stress analysis: $(\tau/\sigma')_{max} = \tan \phi'$ failure criterion	282
6.10	Cross-coupling of shear and volumetric effects due to anisotropy	228		8.2.2 Short-term, total stress analysis: $\tau_{max} = \tau_u$ failure criterion	282
	Key points	229	8.3	Simple upper bound solutions for shallow strip footings	283
	Questions	230		8.3.1 Short-term total stress analysis: $\tau_{max} = \tau_u$ failure criterion	283
	References	232		8.3.2 Effective stress analysis: $(\tau/\sigma')_{max} = \tan \phi'$ failure criterion	284
7	The application of plasticity and limit equilibrium methods to retaining walls	233	8.4	Bearing capacity enhancement factors to account for foundation shape and depth and soil weight	286
7.1	Engineering plasticity	233		8.4.1 Effective stress analysis: $(\tau/\sigma')_{max} = \tan \phi'$ failure criterion	286
7.2	Upper and lower bounds (safe and unsafe solutions)	234		8.4.2 Short-term total stress analysis: $\tau_{max} = \tau_u$ failure criterion	287
7.3	Failure criteria for soils	235	8.5	Simple piled foundations: ultimate axial loads of single piles	287
	7.3.1 $(\tau/\sigma')_{max} = \tan \phi'$ failure criterion	235		8.6 ϕ'_{crit} or ϕ'_{peak} ?	289
	7.3.2 ϕ'_{crit} or ϕ'_{peak} ?	236	8.7	Pile groups	293
	7.3.3 $\tau_{max} = \tau_u$ failure criterion	236	8.8	Lateral loads on piles	294
7.4	Retaining walls	237			
7.5	Calculation of limiting lateral earth pressures	241			
7.6	Development of simple stress field (lower				

8.8.1	Effective stress analysis: (τ/σ') _{max} = tan ϕ' failure criterion	295	Key points	338	
8.8.2	Total stress analysis: $\tau_{max} = \tau_u$ failure criterion	296	Questions	339	
8.9	Introductory slope stability: the infinite slope	297	Reference	340	
8.10	Analysis of a more general slope	300	10 Particular types of earth retaining system	341	
8.10.1	Total stress analysis for the undrained stability of slopes in clays	300	10.1	Introduction and objectives	341
8.10.2	Effective stress analysis of a general slope with a circular slip surface	302	10.2	Embedded retaining walls under working conditions	341
8.10.3	Non-circular slips	304	10.3	Calculation of design bending moments and prop loads	344
	Key points	307	10.4	Embedded walls retaining clay soils	345
	Questions	308	10.4.1	Time-scale over which undrained conditions apply	345
	References	310	10.4.2	Effect of high <i>in situ</i> lateral stresses	346
9	Calculation of bearing capacity factors and earth pressure coefficients for more difficult cases, using plasticity methods	312	10.5	Geostructural mechanism to estimate wall movement under working conditions	353
9.1	Introduction and objectives	312	10.6	Effect of relative soil: wall stiffness	356
9.2	Stress discontinuities: ϕ' analysis	313	10.6.1	Model tests on walls in dry sand	356
9.3	Stress discontinuities: τ_u analysis	314	10.6.2	Analytical methods	357
9.4	Application to stress analysis	315	10.6.3	Soil/wall stiffness: a general approach	359
9.4.1	General approach	315	10.7	Compaction stresses behind backfilled walls	362
9.4.2	Visualization of stress fields using characteristic directions	316	10.7.1	Free-draining soils	362
9.5	Shallow foundations	317	10.7.2	Clays	366
9.5.1	Calculation of improved bearing capacity factor for a shallow foundation subjected to a vertical load: effective stress (ϕ') analysis	317	10.8	Strip loads	366
9.5.2	Calculation of improved bearing capacity factor for a shallow foundation subjected to a vertical load: total stress (τ_u) analysis	318	10.9	Multi-propped embedded walls	367
9.6	Calculation of earth pressure coefficients for rough retaining walls	324	10.10	Reinforced soil walls	367
9.6.1	Wall friction: effective stress (ϕ') analysis	324	10.11	Tunnels	369
9.6.2	Wall adhesion: total stress (τ_u) analysis	327	10.11.1	Stress analysis of a tunnel of circular cross-section	371
9.7	Sloping backfill	329	10.11.2	Collapse of tunnels in clay: short-term total stress analysis	372
9.7.1	Effective stress (ϕ') analysis	329	10.11.3	Collapse of tunnels: effective stress analysis	372
9.7.2	Total stress (τ_u) analysis	329	10.11.4	Collapse of tunnel headings	373
9.8	A wall with a sloping (battered) back	330	10.11.5	Ground movements due to tunnelling	374
9.8.1	Effective stress (ϕ') analysis	331		Key points	375
9.8.2	Total stress (τ_u) analysis	331		Questions	375
9.9	Improved upper bounds for shallow foundations	334		References	378
9.9.1	Total stress (τ_u) analysis	334	11 Modelling, <i>in situ</i> testing and ground improvement	380	
9.9.2	Effective stress (ϕ') analysis	337	11.1	Introduction and objectives	380
			11.2	Modelling	380
			11.2.1	Numerical modelling	381
			11.2.2	Physical modelling: geotechnical centrifuge testing	385
			11.3	<i>In situ</i> testing	389

11.3.1	The Standard Penetration Test	389	11.4.6	Heavy tamping	408
11.3.2	The cone penetrometer test	392	11.4.7	Cement and lime stabilization	408
11.3.3	Pressuremeter tests	394	11.4.8	Soil reinforcement methods	409
11.3.4	The vane shear test	401	11.4.9	Assessing the success of ground improvement techniques	410
11.3.5	The plate bearing test	402		Key points	410
11.4	Ground improvement techniques	403		Questions	411
11.4.1	Electro-osmosis	403		References	412
11.4.2	Ground freezing	405		Index	415
11.4.3	Grouting	406			
11.4.4	Preloading	407			
11.4.5	Surface compaction	407
