Introduction	1
Chapter 1. Stationary Flows of an Ideal Fluid on the Plane	11
§1. Pressure field in a neighborhood of a singular point	11
1.1. Nondegenerate singular points	11
1.2. The stream function	12
1.3. Euler fields	12
§2. Other properties of plane flows	14
2.1. Equivalent forms of Euler's equations	14
2.2. Reducible fields	15
2.3. Frozen-in vortices	16
2.4. Simple domains	18
2.5. Holomorphic flows	20
Chapter 2. Topology of Two-Dimensional Flows	23
§3. An extended version of some Morse constructions	23
3.1. Admissible stream functions	23
3.2. The basic integer relations	27
3.3. Graphs and chambers	30
3.4. The structure of admissible functions	33
§4. Portraits of potential flows	37
§5. Imposition of a vortex on a simple passing flow	46
§6. Imposition of a vortex on an inverse flow	49
Chapter 3. A Two-Dimensional Passing Flow Problem for Stationary Euler Equations	53
§7. Uniqueness of an analytic solution	53
7.1. Formulation of the problem	53
7.2. The uniqueness theorem	56
§8. Analysis of the uniqueness of a smooth flow	58
8.1. The choice of the region of prescribed vorticity	58
8.2. Uniqueness of an open flow	58
8.3. Nonuniqueness of a developed flow	60
8.4. Problems on simple passing and inverse flows	62
§9. Existence theorems	65
9.1. Auxiliary boundary problem	65
9.2. The vortex catastrophe	72
§10. Regular functionals	74
10.1. The closure of a smooth operator	74

10.2. The conditions for splitting	77
10.3. The existence of a critical point	80
10.4. An abstract version of the eigenvalue problem	83
Chapter 4. The Dissipative Top and the Navier-Stokes Equations	89
§11. Axioms of the dissipative top	89
11.1. Plane flows of a viscous incompressible fluid	89
11.2. Quasicompact Lie algebras	92
11.3. The equation of the top. A local uniqueness theorem	94
11.4. Types of dissipative tops	97
11.5. The existence and completeness of the system of principal rotations	101
11.6. The basic scalar relations	104
§12. Stability of a principal rotation	105
12.1. A nonlocal uniqueness theorem	105
12.2. A nonlocal theorem on stability	108
§13. Generalized solutions of the equation of the top	112
13.1. Spatial flows of a viscous incompressible fluid	112
13.2. An extension of the class of admissible right-hand sides	116
13.3. The existence of a generalized solution	117
§14. Examples of dissipative tops	123
14.1. Motions on the algebra $so(n, R)$	123
14.2. Flows on two-dimensional manifolds	125
14.3. Flows on a three-dimensional torus	129
14.4. An example of violation of quasicompactness	130
Chapter 5. Specific Features of Turbulence Models	133
§15. Wave properties of turbulent flows	133
15.1. An "ideal" turbulent medium	133
15.2. Field of small perturbations	134
15.3. Characteristics	137
15.4. Effects of viscosity	140
15.5. A proposition on characteristics	146
§16. Passage to turbulent regime and bifurcation	151
16.1. The closure scheme	151
16.2. An illustrative example	154
16.3. Analysis of the bifurcation problem	154
16.4. The existence of a minimizing element	160
Appendix. Formal Constructions Connected with Euler Equations	163
§17. Continuous models of some Lagrangian systems	163
17.1. Notation	163
17.2. Natural motions and the Euler equations	167
17.3. The stationary action principle	170
17.4. Translational movements and motions along geodesics	176
17.5. Equations of relativistic hydrodynamics	177
17.6. The concept of the integrating factor	185
17.7. The invariant form of the Navier-Stokes equations	187
References	191
