Preface *page* xv

1 Introduction 1
1.1 Aperiodically Modulated Oscillator Chains 4
1.2 A Brief History of Aperiodic Optics 9
1.2.1 One-Dimensional Aperiodic Structures 10
1.2.2 Energy Spectra and Nonlinear Dynamics 14
1.3 Scope of This Book 19

2 Electromagnetics Background 23
2.1 Maxwell's Equations 23
2.2 What Do They Mean? 24
2.3 The Lorentz Equation 25
2.3.1 Electromagnetic Potentials 26
2.3.2 Green Function and Radiation Potentials 28
2.3.3 Green Function and Density of States 32
2.4 Maxwell's Equations in Materials 34
2.4.1 Macroscopic Field Averages 34
2.4.2 Polarization and Magnetization Response 35
2.4.3 The Auxiliary Macroscopic Fields 36
2.4.4 Constitutive Relations 38
2.4.5 Optical Dispersion and Nonlocality 39
2.4.6 Boundary Conditions 40
2.5 Spectral Representation of Time-Dependent Fields 43
2.5.1 Time-Harmonic Fields 44
2.6 Maxwell's Equations in K-Space 45
2.7 General Wave Equations 48
2.7.1 The Complex Refractive Index 48
2.8 Optical Radiation 52
2.8.1 The Dyadic Green Function 52
2.8.2 Dyads and Dyadics 54
2.8.3 Dyadic Source-Field Relations 55
2.9 Light Scattering as a Radiation Problem 59
2.9.1 Light Scattering and Volume Integral Equations 59
2.9.2 Far-Field Scattering by Small Objects 62

Table of Contents
More Information

3 Optical Dispersion Models 65
3.1 Classical Dispersion Models 65
3.1.1 The Lorentz Oscillator Model 65
3.1.2 The Drude–Sommerfeld Model 71
3.2 Waves in Dispersive Media 74
3.2.1 Waves in Plasmas 74
3.2.2 Waves in Dielectrics 77
3.2.3 Polaritons as Hybrid Light–Matter Excitations 80
3.3 Surface Polariton Waves 82
3.3.1 Dispersion of Surface Plasmon Polariton Waves 83
3.4 Polarizability and Local Field Corrections 86
3.4.1 Electromagnetic Mixing Rules 88
3.4.2 Radiative Corrections 90
3.4.3 Spatial Correlation Corrections 91
3.5 What Are Metamaterials? 93

4 Wave Propagation and Diffraction 95
4.1 Optical Wave Packets 95
4.1.1 Velocity of Wave Packets 96
4.1.2 Propagation of Wave Packets 98
4.1.3 Pulse Dynamics with Neural Networks 102
4.2 Scalar Diffraction Theory 106
4.2.1 A Brief History of Wave Diffraction 107
4.2.2 Helmholtz and Kirchhoff Integral Theorem 108
4.2.3 The Fresnel–Kirchhoff Diffraction Formula 110
4.2.4 The Rayleigh–Sommerfeld Formulation of Diffraction 113
4.2.5 Angular Spectrum Representation of Fields 116
4.2.6 The Paraxial Helmholtz Equation 121
4.2.7 Fractional Fourier Transform in Wave Diffraction 123
4.3 The Stratton–Chu Integral Representation 126

5 Diffraction in Optical Engineering 131
5.1 Linear Optical Systems 131
5.1.1 Fourier Properties of Paraxial Focusing 134
5.1.2 Diffractive Optical Elements 136
5.1.3 Fresnel Zone Plates 139
5.1.4 Optical Superoscillations 141
5.1.5 Phase-Modulated Axilenses 143
5.1.6 Time-Domain Diffraction 145
5.1.7 Space-Time Duality 146
5.1.8 Time Lenses and Temporal Optics 148
5.2 Natural Focusing and Diffraction Caustics 150
5.2.1 Diffraction and Catastrophe Theory 151

Table of Contents
More Information

5.2.2 Engineering Diffraction Caustics 154
5.2.3 Optical Rogue Waves 158
5.2.4 Singular Optics 160
5.3 What Is Meta-Optics? 161
5.3.1 Metasurface Engineering 162

6 Wave Scattering and Coherence 164
6.1 Classical Versus Quantum Scattering 164
6.1.1 The Classical Scattering Potential 165
6.2 Wave Scattering Formalism 166
6.2.1 The Multiple Scattering Solution 169
6.2.2 Basic Scattering Parameters 171
6.2.3 Inverse Scattering in the Born Approximation 175
6.3 The Optical Theorem 178
6.3.1 The Optical Theorem for Vector Fields 181
6.4 The Description of Partially Coherent Waves 186
6.4.1 Mathematical Description of Optical Coherence 186
6.4.2 Coherence Time, Coherence Length, and Spectral Width 189
6.4.3 Optical Coherence in the Space-Frequency Domain 191
6.4.4 Unified Theory of Coherence and Polarization 193
6.5 Coherence Effects in Scattering and Diffraction 195
6.5.1 The van Cittert–Zernike Theorem 195
6.5.2 Scattering by Deterministic Media 198
6.5.3 Scattering by Random Media 200
6.5.4 The Schell Scattering Theorem 203

7 Structure Factor and Diffraction 208
7.1 Single Scattering and Geometry 208
7.2 The Structure Factor and Its Meaning 210
7.2.1 Form Factor and Kinematic Scattering 217
7.2.2 Fundamental Equations of Kinematic Scattering 218
7.2.3 Kinematic Diffraction of Periodic Structures 219
7.2.4 The Dynamic Structure Factor 221
7.2.5 The Origin of Reciprocal Space 222
7.2.6 The Phase Problem and the Autocorrelation Approach 223
7.3 Structure Factor and Antenna Theory 224
7.4 Radiation Properties of Aperiodic Arrays 228
7.5 Examples of Structure Factor Calculations 232
7.5.1 Single Scattering of Incoherent Radiation 236
7.5.2 Periodic and Quasiperiodic Structures 237
7.5.3 More Complex Aperiodic Structures 240
7.5.4 Uniform Random Structures 243
7.6 Lattice Resonance in Particle Arrays 243

Table of Contents
More Information

8 Tailored Disorder 247
8.1 Random Media in the Single-Scattering Regime 247
8.1.1 Statistical Description of Random Many-Particle Systems 248
8.1.2 Particle Densities and Distribution Functions 250
8.1.3 The Ornstein–Zernike Integral Equation 252
8.1.4 The Percus–Yevick Structure Factor 255
8.2 Speckle Phenomena and Random Walks 257
8.2.1 Fully Developed Speckle 260
8.2.2 Finite Sums: The Kluyver–Pearson Formula 264
8.2.3 Correlations in Speckle Statistics 267
8.3 Correlated Walks and Anomalous Transport 269
8.3.1 Beyond Gaussian Statistics: Stable Distributions 271
8.3.2 The Continuous Time Random Walk (CTRW) 273
8.3.3 The Approach of Fractional Transport 276
8.4 Hyperuniform Point Patterns 278
8.4.1 Fluctuations in Random Point Patterns 281
8.4.2 Fluctuations in Deterministic Point Patterns 285
8.4.3 Classification of Hyperuniform Systems 287
8.4.4 Numerical Optimization of Arbitrary Point Patterns 289
8.5 Equidistributed Sequences and Light Scattering 291
8.5.1 Low-Discrepancy Sequences and Subrandomness 293
8.5.2 Correlations Analysis of Aperiodic Arrays 296

9 Fundamentals of Number Theory 300
9.1 Arithmetic Functions 300
9.1.1 Multiplicative Functions 301
9.1.2 Multifractal Scaling of Complex Signals 305
9.1.3 Additive Functions 309
9.1.4 The von Mangoldt Function 311
9.2 The Riemann Zeta Function 314
9.2.1 The Hardy Zeta Function 318
9.2.2 Multifractality of the Riemann's Zeros 320
9.2.3 The Distribution of Prime Numbers 321
9.2.4 The Riemann–von Mangoldt Explicit Formula 323
9.2.5 Liouville's λ Function and Riemann's Hypothesis 325
9.3 Riemann's Zeros and Random Matrices 328
9.3.1 Prime Numbers and Quantum Chaos 331
9.3.2 L-Functions and the Structure of Primes 333
9.3.3 Multifractality and Hyperuniformity of Prime Numbers 338
9.4 Continued Fractions and Approximation 342
9.4.1 Convergents and Recursion Formulas 344
9.4.2 Periodic Expansions and Quadratic Surds 346
9.4.3 Diophantine Approximation 347

More Information

10 Aperiodic Order in Number Theory 350
10.1 Almost Periodic and Quasiperiodic Functions 350
10.1.1 Spectral Representation 353
10.2 Poisson Behavior in Number Theory 354
10.2.1 Equidistributed Sequences and Poisson Behavior 355
10.2.2 Arithmetic Randomness and Chaos 356
10.2.3 Deterministic Arrays with Poisson Behavior 358
10.2.4 Visualizing "Arithmetic Randomness" 360
10.3 Prime Numbers and Aperiodic Arrays 362
10.3.1 Quadratic Fields and Integer Rings 362
10.3.2 Primes and Irreducibles 368
10.3.3 Moat Problems and Primes Constellations 371
10.4 Finite Fields 374
10.4.1 The Discrete Logarithm 377
10.4.2 Galois Extension Fields and Pseudorandomness 378
10.4.3 Elliptic Curves over Finite Fields 382
10.4.4 Generating Weak and Strong Pseudorandomness 387
10.4.5 Pseudorandomness and Coded Apertures 389
10.5 Randomness, Complexity, and Information 391
10.5.1 Randomness and Information Theory 393
10.5.2 Testing Randomness 397
10.5.3 Randomness and Structure 400

11 Aperiodic Order and Geometry 401
11.1 The Mathematics of Lattices 401
11.1.1 Lattices and Tilings 403
11.2 Crystalline Symmetries 405
11.2.1 Point and Space Groups 406
11.2.2 The Crystallographic Restriction 407
11.3 From Lattices to $\mathbb{Z}$-Modules 409
11.3.1 Incommensurate Modulated Structures 412
11.3.2 Incommensurate Composite Structures 415
11.3.3 Wang Tiles: Where Logic Meets Geometry 417
11.3.4 Aperiodic Tilings and Quasicrystals 418
11.3.5 Aperiodic Order from Phyllotaxis 423
11.3.6 Multifractal Analysis of Vogel Spirals 427
11.4 Concepts of Mathematical Diffraction Theory 430
11.4.1 Delone Sets 430
11.4.2 Dirac Comb and Autocorrelation Measures 432
11.4.3 Crystallographic Structures 434
11.4.4 Incommensurately Modulated Structures 435
11.4.5 Diffraction from Model Sets 437
11.4.6 Diffraction from Quasiperiodic Chains 440
11.4.7 Diffraction from Limit-Periodic Structures 442

Table of Contents
More Information

11.4.8 Singular Continuous Measures 442
11.4.9 Engineering Diffuse Scattering 446
11.5 Which Distributions of Matter Diffract? 448

12 Multiple Scattering 451
12.1 Green Function Perturbation Theory 451
12.1.1 Self-Consistent Solution of the Scattering Problem 452
12.1.2 Physical Meaning of the S-Matrix 455
12.1.3 The Diagrammatic Notation 457
12.2 Multiple Scattering of Scalar Waves 458
12.2.1 Foldy–Lax Multiple Scattering Equations 460
12.2.2 Foldy–Lax Equations for Point Scatterers 461
12.2.3 Resonances and Green's Matrix 463
12.2.4 Physical Meaning of the T-Matrix 464
12.2.5 Multiple Scattering and Refractive Index 466
12.3 Extension to Vector Wave Scattering 467
12.3.1 Vector Point Scattering Model 470
12.3.2 The Discrete Coupled Dipoles Model 472
12.3.3 Extension to Coupled Electric and Magnetic Dipoles 475
12.3.4 Spontaneous Decay Rate of a Dipole Emitter 484
12.4 The Dyadic Green's Matrix Method 486
12.4.1 Spectral Properties of Random Arrays 489
12.4.2 Level Statistics in Complex Media 493
12.4.3 Resonances of Deterministic Aperiodic Arrays 497
12.4.4 Green's Matrix with Electric and Magnetic Dipoles 499

13 Analytical Scattering Theory 503
13.1 The Mie–Lorenz Scattering Theory 503
13.1.1 Separation of Variable Solution 504
13.1.2 Field Expansions 509
13.1.3 The Mie–Lorenz Coefficients 513
13.1.4 Nanoplasmonics and Surface Modes 516
13.1.5 Scattering from Magnetic Spheres 520
13.1.6 Mie Theory and Metamaterials Design 523
13.2 Two-Dimensional Generalized Mie Theory 525
13.2.1 Applications to Resonant Field Design 527
13.2.2 Applications to Photonic Bandgap Structures 530
13.3 Three-Dimensional Generalized Mie Theory 534
13.3.1 Representing the Local Fields 534
13.3.2 Implementing the Foldy–Lax Scheme 536
13.3.3 Scattering and Extinction of Aggregates 539
13.4 T-Matrix for Nonspherical Particles 540
13.4.1 Huygens Principle and the Null-Field Method 541

14 Transport and Localization 544
14.1 Scales of Radiation Transport 544
14.2 Continuous Random Media 546
14.2.1 The Average Green Function 546
14.2.2 The Model of Disorder 547
14.2.3 Diagrammatics 548
14.2.4 Dyson's Equation 551
14.2.5 Self-Energy and Nonlocal Susceptibility 552
14.2.6 The Effective Medium 553
14.2.7 The Bethe–Salpeter Equation 554
14.3 Multiparticle Random Media 560
14.3.1 Homogenization of Metamaterials 564
14.4 Intensity Transport 565
14.4.1 The Ladder Approximation 569
14.4.2 Microscopic Derivation of Diffusion 572
14.4.3 Photonic Ohm's Law 573
14.4.4 Diffusion Propagator for a Slab 574
14.4.5 Total Transmission and Reflection for Diffuse Light 576
14.4.6 Spatial Profile of Diffuse Light 578
14.4.7 Time-Resolved Diffused Light 579
14.5 Mesoscopic Scattering Phenomena 582
14.5.1 Weak Localization 583
14.6 Anderson Localization 587
14.6.1 Scaling Theory of Localization 590
14.7 Random Lasers 593
14.7.1 The Letokhov Diffusion Model 594
14.7.2 Fractional Random Lasers 595

Appendix A Bound Sources 599

Appendix B Longitudinal and Transverse Vector Fields 602
B.1 Helmholtz Field Decomposition 602

Appendix C Essentials of Random Processes 604
C.1 Stationary Processes and Ergodicity 607
C.2 Autocorrelation and Cross-Correlation 608
C.3 The Wiener–Khintchine Theorem 610
C.4 Linear Systems and Random Processes 612
C.5 Karhunen–Loéve Expansion of Random Processes 615
C.6 Gaussian Processes and Their Representations 616
C.6.1 Gaussian Vectors and Random Processes 617
C.6.2 Brownian Motion and Colored Noise 617
C.7 Additional Examples of Random Processes 620
C.7.1 The Itô Formula and Its Derivation 626
