To My Parents

Preface

Partial functional differential equations arise from many biological, chemical, and physical systems which are characterized by both spatial and temporal variables and exhibit various spatio-temporal patterns. The systematic study of such equations from the dynamical systems and semigroups point of view began in the 70s, and considerable advances have been achieved since then.

However, most existing results on partial functional differential equations are scattered throughout the research journals, and these results have been obtained by using various methods, concepts, and results from semigroup theory, dynamical system theory, linear and nonlinear functional analysis, ordinary and partial differential equations, and functional differential equations. This makes it difficult for a newcomer to enter into this important research field.

The aim of this book is to provide an introduction to the qualitative theory and applications of semilinear partial functional differential equations from the dynamical systems point of view. The book will focus on those important techniques which have been developed and utilized to generalize various results from ordinary (functional, partial) differential equations to semilinear partial functional differential equations. Special emphasis will be on reaction diffusion equations with delays in the nonlinear reaction terms, and a considerable part of this book will be devoted to the demonstration of how the interaction of spatial diffusion and time delay gives rise to complicated dynamical behaviors and spatio-temporal patterns. Various applications will be provided to motivate and to demonstrate general theory.

I have attempted to make the book as self-contained as possible by including some preliminary materials on semigroups and partial differential equations. Thus the prerequisites are at the level of a graduate student. I hope that my style of presentation will be appealing to people trained and interested in qualitative theory of ordinary and functional differential equations.

It should be emphasized that the choice of material is highly subjective. In particular, this book does not treat reaction diffusion equations with delay in those terms containing spatial partial derivatives. Also, the already lengthy list of references is by no means exhaustive, and I apologize for the exclusion of many other related works.

I would like to acknowledge the encouragement and advice of Professor Jack Hale and Glen Webb, and I am deeply indebted to two scientific advisors of this series for their support and many valuable comments which lead to significant improvements. Special thanks are due to Professor Leon Glass and Professor Raymond Kapral for their helpful suggestions and comments. I am also grateful to the editors and production staff at Springer-Verlag for their assistance.

I wish to express my great appreciation to Professor Joseph So for initially inspiring me to write this book, for his generous help and for his careful reading of the earlier version of the book. Professor Herb Freedman, Professor M. Muldoon, and Professor Shigui Ruan also read various portions of the manuscript and offered many helpful comments which are greatly appreciated. I would like to express my gratitude to Professor Lynn Erbe, Professor Herb Freedman, Professor John Haddock, Professor Senlin Li and Professor Zhicheng Wang for teaching me the theory and applications of differential equations and dynamical systems and for being constant sources of inspiration and encouragement.

It is a great pleasure to acknowledge the financial support from the Natural Sciences and Engineering Research Council of Canada. I would also like to thank the Faculty of Arts (York University) for supporting this project by awarding me a fellowship during 1993-94.

Finally, I would like to thank my wife Ming for her understanding and support during the production of this book.

Contents

Preface	vii
Introduction	1
1. Preliminaries	20
1.1 Semigroups and generators	20
1.2 Function spaces, elliptic operators, and maximal principles	30
Bibliographical Notes	34
2. Existence and Compactness of Solution Semiflows	36
2.1 Existence and compactness	36
2.2 Local existence and global continuation	46
2.3 Extensions to neutral partial functional differential equations ..	51
Bibliographical Notes	61
3. Generators and Decomposition of State Spaces for Linear Systems	65
3.1 Infinitesimal generators of solution semiflows of linear systems	65
3.2 Decomposition of state spaces by invariant subspaces	76
3.3 Computation of center, stable, and unstable subspaces	80
3.4 Extensions to equations with infinite delay	87
3.5 L^2 -stability and reduction of neutral equations	97
Bibliographical Notes	108
4. Nonhomogeneous Systems and Linearized Stability ...	111
4.1 Dual operators and an alternative theorem	111
4.2 Variation of constants formula	115
4.3 Existence of periodic or almost periodic solutions	120
4.4 Principle of linearized stability	123
4.5 Fundamental transformations and representations of solutions	127
Bibliographical Notes	141
5. Invariant Manifolds of Nonlinear Systems	143
5.1 Stable and unstable manifolds	143
5.2 Center manifolds	149
5.3 Flows on center manifolds	162
5.4 Global invariant manifolds of perturbed wave equations	167
Bibliographical Notes	180

6. Hopf Bifurcations	182
6.1 Some classical Hopf bifurcation theorems for ODEs	182
6.2 Smooth local Hopf bifurcations: a special case	186
6.3 Some examples from population dynamics	196
6.4 Smooth local Hopf bifurcations: general situations	204
6.5 A topological global Hopf bifurcation theory	214
6.6 Global continuation of wave solutions	222
Bibliographical Notes	241
7. Small and Large Diffusivity	244
7.1 Destablization of periodic solutions by small diffusivity	244
7.2 Large diffusivity under Neumann boundary conditions	262
Bibliographical Notes	266
8. Invariance, Comparison, and Upper and Lower Solutions	268
8.1 Invariance and inequalities	268
8.2 Systems and strict inequalities	280
8.3 Applications to reaction diffusion equations with delay	286
Bibliographical Notes	293
9. Convergence, Monotonicity, and Contracting Rectangles	295
9.1 Monotonicity and generic convergence	295
9.2 Stability and steady state solutions of quasimonotone systems	305
9.3 Comparison and convergence results	309
9.4 Applications to Lotka-Volterra competition models	315
Bibliographical Notes	321
10. Dispativeness, Exponential Growth, and Invariance Principles	323
10.1 Point dispativeness in a scalar equation	323
10.2 Convergence in a scalar equation	328
10.3 Exponential growth in a scalar equation	333
10.4 An invariance principle	342
Bibliographical Notes	347
11. Traveling Wave Solutions	349
11.1 Huxley nonlinearities and phase plane arguments	351
11.2 Delayed Fisher equation: sub-super solution method	363
11.3 Systems and monotone iteration method	371
11.4 Traveling oscillatory waves	382
Bibliographical Notes	395
Bibliography	400
Index	427
