

Introducing Einstein's Relativity

Ray d'Inverno

Faculty of Mathematical Studies, University of Southampton

CLARENDON PRESS • OXFORD

Contents

Overview	1	3.3 Length contraction	32
1. The organization of the book	3	3.4 Time dilation	33
1.1 Notes for the student	3	3.5 Transformation of velocities	34
1.2 Acknowledgements	4	3.6 Relationship between space-time diagrams of inertial observers	35
1.3 A brief survey of relativity theory	6	3.7 Acceleration in special relativity	36
1.4 Notes for the teacher	8	3.8 Uniform acceleration	37
1.5 A final note for the less able student	10	3.9 The twin paradox	38
<i>Exercises</i>	11	3.10 The Doppler effect	39
		<i>Exercises</i>	40
Part A. Special Relativity	13	4. The elements of relativistic mechanics	42
2. The k-calculus	15	4.1 Newtonian theory	42
2.1 Model building	15	4.2 Isolated systems of particles in Newtonian mechanics	44
2.2 Historical background	16	4.3 Relativistic mass	45
2.3 Newtonian framework	16	4.4 Relativistic energy	47
2.4 Galilean transformations	17	4.5 Photons	49
2.5 The principle of special relativity	18	<i>Exercises</i>	51
2.6 The constancy of the velocity of light	19		
2.7 The k -factor	20	Part B. The Formalism of Tensors	53
2.8 Relative speed of two inertial observers	21	5. Tensor algebra	55
2.9 Composition law for velocities	22	5.1 Introduction	55
2.10 The relativity of simultaneity	23	5.2 Manifolds and coordinates	55
2.11 The clock paradox	24	5.3 Curves and surfaces	57
2.12 The Lorentz transformations	25	5.4 Transformation of coordinates	58
2.13 The four-dimensional world view	26	5.5 Contravariant tensors	60
<i>Exercises</i>	28	5.6 Covariant and mixed tensors	61
3. The key attributes of special relativity	29	5.7 Tensor fields	62
3.1 Standard derivation of the Lorentz transformations	29	5.8 Elementary operations with tensors	63
3.2 Mathematical properties of Lorentz transformations	31	5.9 Index-free interpretation of contravariant vector fields	64
		<i>Exercises</i>	67

6. Tensor calculus	68	8.8 Covariant formulation of relativistic mechanics	117
6.1 Partial derivative of a tensor	68	<i>Exercises</i>	119
6.2 The Lie derivative	69	9. The principles of general relativity	120
6.3 The affine connection and covariant differentiation	72	9.1 The role of physical principles	120
6.4 Affine geodesics	74	9.2 Mach's principle	121
6.5 The Riemann tensor	77	9.3 Mass in Newtonian theory	125
6.6 Geodesic coordinates	77	9.4 The principle of equivalence	128
6.7 Affine flatness	78	9.5 The principle of general covariance	130
6.8 The metric	81	9.6 The principle of minimal gravitational coupling	131
6.9 Metric geodesics	82	9.7 The correspondence principle	132
6.10 The metric connection	84	<i>Exercises</i>	132
6.11 Metric flatness	85	10. The field equations of general relativity	134
6.12 The curvature tensor	86	10.1 Non-local lift experiments	134
6.13 The Weyl tensor	87	10.2 The Newtonian equation of deviation	135
<i>Exercises</i>	89	10.3 The equation of geodesic deviation	136
7. Integration, variation, and symmetry	91	10.4 The Newtonian correspondence	139
7.1 Tensor densities	91	10.5 The vacuum field equations of general relativity	141
7.2 The Levi-Civita alternating symbol	92	10.6 The story so far	142
7.3 The metric determinant	93	10.7 The full field equations of general relativity	142
7.4 Integrals and Stokes' theorem	95	<i>Exercises</i>	144
7.5 The Euler-Lagrange equations	96	11. General relativity from a variational principle	145
7.6 The variational method for geodesics	99	11.1 The Palatini equation	145
7.7 Isometries	102	11.2 Differential constraints on the field equations	146
<i>Exercises</i>	103	11.3 A simple example	147
Part C. General Relativity	105	11.4 The Einstein Lagrangian	148
8. Special relativity revisited	107	11.5 Indirect derivation of the field equations	149
8.1 Minkowski space-time	107	11.6 An equivalent Lagrangian	151
8.2 The null cone	108	11.7 The Palatini approach	152
8.3 The Lorentz group	109	11.8 The full field equations	153
8.4 Proper time	111	<i>Exercises</i>	154
8.5 An axiomatic formulation of special relativity	112		
8.6 A variational principle approach to classical mechanics	114		
8.7 A variational principle approach to relativistic mechanics	116		

12. The energy–momentum tensor	155	15.3	Advance of the perihelion of Mercury	195
12.1 Preview	155	15.4	Bending of light	199
12.2 Incoherent matter	155	15.5	Gravitational red shift	201
12.3 Perfect fluid	157	15.6	Time delay of light	204
12.4 Maxwell's equations	158	15.7	The Eötvös experiment	205
12.5 Potential formulation of Maxwell's equations	160	15.8	Solar oblateness	206
12.6 The Maxwell energy–momentum tensor	162	15.9	A chronology of experimental and observational events	207
12.7 Other energy–momentum tensors	163	15.10	Rubber-sheet geometry	207
12.8 The dominant energy condition	164	<i>Exercises</i>		209
12.9 The Newtonian limit	165			
12.10 The coupling constant	167			
<i>Exercises</i>	168			
13. The structure of the field equations	169	Part D. Black Holes		211
13.1 Interpretation of the field equations	169	16. Non-rotating black holes		213
13.2 Determinacy, non-linearity, and differentiability	170	16.1 Characterization of coordinates	213	
13.3 The cosmological term	171	16.2 Singularities	214	
13.4 The conservation equations	173	16.3 Spatial and space-time diagrams	215	
13.5 The Cauchy problem	174	16.4 Space-time diagram in Schwarzschild coordinates	216	
13.6 The hole problem	177	16.5 A radially infalling particle	218	
13.7 The equivalence problem	178	16.6 Eddington–Finkelstein coordinates	219	
<i>Exercises</i>	179	16.7 Event horizons	221	
14. The Schwarzschild solution	180	16.8 Black holes	223	
14.1 Stationary solutions	180	16.9 A classical argument	224	
14.2 Hypersurface-orthogonal vector fields	181	16.10 Tidal forces in a black hole	225	
14.3 Static solutions	183	16.11 Observational evidence for black holes	226	
14.4 Spherically symmetric solutions	184	16.12 Theoretical status of black holes	227	
14.5 The Schwarzschild solution	186	<i>Exercises</i>	229	
14.6 Properties of the Schwarzschild solution	188			
14.7 Isotropic coordinates	189	17. Maximal extension and conformal compactification		230
<i>Exercises</i>	190	17.1 Maximal analytic extensions	230	
15. Experimental tests of general relativity	192	17.2 The Kruskal solution	230	
15.1 Introduction	192	17.3 The Einstein–Rosen bridge	232	
15.2 Classical Kepler motion	192	17.4 Penrose diagram for Minkowski space-time	234	
		17.5 Penrose diagram for the Kruskal solution	237	
		<i>Exercises</i>	238	

18. Charged black holes	239	20.9 Detection of gravitational waves	285
18.1 The field of a charged mass point	239	<i>Exercises</i>	288
18.2 Intrinsic and coordinate singularities	241	21. Radiation from an isolated source	290
18.3 Space-time diagram of the Reissner–Nordström solution	242	21.1 Radiating isolated sources	290
18.4 Neutral particles in Reissner–Nordström space-time	243	21.2 Characteristic hypersurfaces of Einstein's equations	292
18.5 Penrose diagrams of the maximal analytic extensions	244	21.3 Radiation coordinates	293
<i>Exercises</i>	247	21.4 Bondi's radiating metric	294
19. Rotating black holes	248	21.5 The characteristic initial value problem	296
19.1 Null tetrads	248	21.6 News and mass loss	297
19.2 The Kerr solution from a complex transformation	250	21.7 The Petrov classification	299
19.3 The three main forms of the Kerr solution	251	21.8 The peeling-off theorem	301
19.4 Basic properties of the Kerr solution	252	21.9 The optical scalars	302
19.5 Singularities and horizons	254	<i>Exercises</i>	303
19.6 The principal null congruences	256	Part F. Cosmology	305
19.7 Eddington–Finkelstein coordinates	258	22. Relativistic cosmology	307
19.8 The stationary limit	259	22.1 Preview	307
19.9 Maximal extension for the case $a^2 < m^2$	260	22.2 Olbers' paradox	308
19.10 Maximal extension for the case $a^2 > m^2$	261	22.3 Newtonian cosmology	310
19.11 Rotating black holes	262	22.4 The cosmological principle	312
19.12 The singularity theorems	265	22.5 Weyl's postulate	314
19.13 The Hawking effect	266	22.6 Relativistic cosmology	315
<i>Exercises</i>	268	22.7 Spaces of constant curvature	317
Part E. Gravitational Waves	269	22.8 The geometry of 3-spaces of constant curvature	319
20. Plane gravitational waves	271	22.9 Friedmann's equation	322
20.1 The linearized field equations	271	22.10 Propagation of light	324
20.2 Gauge transformations	272	22.11 A cosmological definition of distance	325
20.3 Linearized plane gravitational waves	274	22.12 Hubble's law in relativistic cosmology	326
20.4 Polarization states	278	<i>Exercises</i>	329
20.5 Exact plane gravitational waves	280	23. Cosmological models	331
20.6 Impulsive plane gravitational waves	282	23.1 The flat space models	331
20.7 Colliding impulsive plane gravitational waves	283	23.2 Models with vanishing cosmological constant	334
20.8 Colliding gravitational waves	284	23.3 Classification of Friedmann models	335

23.4	The de Sitter model	337
23.5	The first models	338
23.6	The time-scale problem	339
23.7	Later models	339
23.8	The missing matter problem	341
23.9	The standard models	342
23.10	Early epochs of the universe	343
23.11	Cosmological coincidences	343
23.12	The steady-state theory	344
23.13	The event horizon of the de Sitter universe	348
23.14	Particle and event horizons	349
23.15	Conformal structure of Robertson–Walker space-times	351

23.16	Conformal structure of de Sitter space-time	352
23.17	Inflation	354
23.18	The anthropic principle	356
23.19	Conclusion	358
	<i>Exercises</i>	359

Answers to exercises	360
