<i>Preface</i>	xi
<i>About the author</i>	xv
<b>I Introduction</b>	<b>1</b>
1 A brief history of simulation	1
1.1 The world's first simulation	1
1.2 Emergence of mathematics and mechanics	3
1.3 Computer age	4
2 Basic steps in simulation	9
2.1 Geometry description	9
2.2 Approximation of the unknown	11
2.3 Solution	12
2.4 Recovery of the results	12
3 A change of paradigm: towards a more efficient and accurate simulation	12
4 Organization of the text	13
<b>2 Stage 1: Basis functions</b>	<b>17</b>
1 One-dimensional basis functions	17
1.1 Lagrange and Serendipity functions	17
1.2 From B-splines to NURBS	22
2 Two-dimensional basis functions	33
2.1 Lagrange and Serendipity functions	33
2.2 B-splines	38
2.3 NURBS	38
2.4 T-splines	40
3 Programming	44
4 The NURBS toolkit	45
5 Summary and conclusions	51
<b>3 Stage 2: Geometry</b>	<b>55</b>
1 Coordinate systems	55
1.1 Coordinate transformation	55
2 Curves	56
2.1 Mapping with Serendipity/Lagrange basis functions	56
2.2 Mapping with NURBS	57

3	Programming	58
3.1	NURBS toolkit	58
3.2	Geometry functions	59
3.3	Examples	63
3.4	Example 1: Circular arc	63
3.5	Example 2: Horseshoe tunnel	65
3.6	Example 3: Plate with hole	67
4	Surfaces	68
4.1	Mapping with Serendipity/Lagrange basis functions	69
4.2	Mapping with NURBS basis functions	70
4.3	Programming	71
5	Surface of revolution	73
5.1	Example 1: Cylindrical surface	74
5.2	Example 2: Spherical surface	75
5.3	Example 3: Bell shaped surface	77
6	Lofted surfaces	79
7	NURBS surfaces with cutouts	81
7.1	Analysis suitable trimmed NURBS surfaces	82
8	Infinite NURBS patch	87
8.1	Example	92
9	Summary and conclusions	93
<b>4</b>	<b>Stage 3: Computer Aided Design</b>	<b>95</b>
1	Introduction	95
2	IGES data structure	98
3	How CAD programs describe geometry – entity types	100
3.1	Line entity (110)	100
3.2	Surface of revolution entity (120)	100
3.3	Rational B-spline entity (126)	101
3.4	Rational B-spline surface entity (128)	101
3.5	Boundary entity (141)	101
4	NURBS surfaces	102
5	Trimmed NURBS surfaces	104
6	Summary and conclusions	113
<b>5</b>	<b>Stage 4: Introduction to numerical simulation</b>	<b>117</b>
1	One-dimensional simulation	117
1.1	Ritz method	119
1.2	Approximation	121
2	Steps in the simulation	126
2.1	Description of the geometry	126
2.2	Description of known values	126
2.3	Convergence tests	127
2.4	Approximation of unknown	128
2.5	P-refinement or order elevation	128
2.6	H-refinement, the Finite Element Method	128
2.7	Knot insertion, isogeometric method	132

2.8	K-refinement	132
2.9	Summary and conclusions	133
3	2-D simulation, plane stress and plane strain	135
3.1	Boundary Conditions (BC)	138
3.2	Using one NURBS patch	140
3.3	Comparison with classical FEM	141
3.4	Example	142
3.5	Multiple NURBS patches	143
3.6	Bezièr elements	147
3.7	Trimmed NURBS patches	148
3.8	Convergence test	150
4	Summary and conclusions	150
<b>6</b>	<b>Stage 5: Plates and shells</b>	<b>153</b>
1	Kirchhoff plate	153
1.1	Plates	154
1.2	Examples	158
2	Kirchhoff shells	161
2.1	Example 1: Scordelis roof	162
2.2	Example 2: Trimmed Scordelis roof	164
2.3	Example 3: Arched Scordelis roof	166
3	Multiple patches	168
3.1	Assembly	168
3.2	Example	169
4	Summary and conclusions	172
<b>7</b>	<b>Stage 6: Integral equations</b>	<b>175</b>
1	Introduction	175
2	Trefftz method	176
2.1	Example	180
2.2	Conclusions	183
3	Integral equations	183
3.1	Theorem of Betti	187
3.2	Rigid body trick	191
3.3	Conclusions	193
4	Numerical solution of integral equations	193
4.1	Nyström method	193
4.2	Galerkin method	196
4.3	Collocation	196
4.4	Discretisation	197
5	Summary and conclusions	199
<b>8</b>	<b>Stage 7: The boundary element method for plane problems</b>	<b>201</b>
1	Introduction	201
2	Classical isoparametric approach	201
2.1	Numerical evaluation of integrals	203

3	NURBS based approach	206
3.1	Boundary conditions	210
4	Assembly of multiple patches	211
4.1	Pure Neumann problem	211
4.2	Mixed Neumann/Dirichlet problem	211
4.3	Symmetry	212
5	Postprocessing	213
5.1	Results on the boundary	213
5.2	Results inside the domain	214
6	Programming	216
7	Examples	227
7.1	Potential problem: Flow past isolator	227
7.2	Elasticity problem: Circular excavation in infinite domain	229
7.3	Practical example: Horseshoe tunnel	231
8	Conclusions	233
<b>9</b>	<b>Stage 8: The boundary element method for three-dimensional problems</b>	<b>235</b>
1	Introduction	235
2	Numerical integration	236
2.1	Regular integration	236
2.2	Determination of the optimal number of Gauss points	237
2.3	Regular integration	238
2.4	Nearly singular integration	239
2.5	Weakly singular integration	243
2.6	Infinite patches	246
3	Symmetry	247
4	Multiple patches	249
5	Postprocessing	249
5.1	Stress recovery	249
5.2	Internal stress computation	251
6	Test examples	252
6.1	Infinite tunnel	252
6.2	Loading on infinite half-space	253
7	Examples	253
7.1	Infinite tunnel in infinite domain near tunnel face	253
7.2	Finite tunnel in a semi-infinite domain	254
7.3	Branched tunnel	255
8	Conclusions	260
<b>10</b>	<b>Stage 9: The boundary element method with volume effects</b>	<b>263</b>
1	Introduction	263
2	Effect of body forces and initial strain	263
2.1	Body forces	264
2.2	Effect of initial strain	265
2.3	Solution	266

3	Implementation for plane problems	266
3.1	Geometry definition	266
3.2	Computation of the volume integral	268
4	Implementation for 3-D problems	268
4.1	Geometry definition	269
4.2	Computation of the volume integral	270
5	Iterative solution algorithm	271
6	Inclusions	273
6.1	Computation of body force	275
6.2	Steps in the analysis	276
7	Inelastic behavior	277
7.1	Yield conditions	278
7.2	Determination of plastic strain increment	280
8	Implementation of plasticity for plane problems	280
8.1	Determination of plastic zone	284
8.2	Computation of the volume term	286
8.3	Numerical integration	287
8.4	Internal stress computation	287
8.5	Extension of plastic zone during iteration	288
9	Implementation for 3-D problems	288
9.1	Determination of the plastic zone	289
9.2	Computation of the volume term	289
9.3	Numerical integration	289
10	Programming	293
11	Example	295
12	Summary and conclusions	295
<b>II</b>	<b>Stage 10: The time domain</b>	<b>297</b>
1	Introduction	297
1.1	Bernoulli beam with mass	298
2	Solutions in the frequency domain	299
2.1	Numerical solution	301
3	Solutions in the time domain	301
3.1	Finite difference method	302
3.2	Newmark method	306
4	Programming	309
5	Summary and conclusions	309
	<b>Appendix: Fundamental solutions</b>	<b>311</b>
1	Stress solution $\Sigma(x,y)$	312
2	Derived solution for displacement $\bar{S}(x,y)$	313
3	Derived solution for traction $\bar{R}(x,y)$	314
4	Derived solution for displacement $S(x,y)$	316
5	Derived solution for traction $R(x,y)$	317
6	Derivatives of kernel $S(x,y)$	319
7	Derivatives of kernel $R(x,y)$	320
	<i>Subject index</i>	325
