

Preface

Slopes are either a natural consequence of geological and geomorphological evolution or the result of mankind's perceived need to modify the landscape by direct or indirect means. Careful consideration of the stability and instability of natural or man-made slopes is central to good engineering practice, and there now exists a large body of knowledge concerning the various parameters, variables and models which are important to a clear understanding of the processes affecting the stability of slopes.

This book draws on this body of knowledge and is directed specifically at engineers and engineering geologists, in practice or in academic life, who are interested in the stability of natural or man-made slopes. Geomorphologists seeking to quantify the mechanics of 'slope-forming processes' will also find much of interest. The reader who has had a grounding in basic soil mechanics will derive most benefit from this book.

In this new edition, as well as correcting a number of minor text errors, I have taken the opportunity to revise and update the text throughout, as befits a progressive subject. Substantial changes include improved cross-referencing of text and figures, better halftone figures, a new chapter containing fourteen case studies, and a new appendix detailing a new widely-accepted method of analysis.

This second edition was developed from the original typescript using WordStar, on an Apricot computer which was then used to do the final preparation of camera-ready copy using Ventura Publisher Professional Extension and a QMS PS810 laser printer.

I would like to thank all those people who gave the first edition such a positive reception, notably reviewers Professor R.J. Chandler, Professor D.G. Fredlund, Mr A.L. Little and Professor M. Popescu, and everybody who wrote with queries or corrections, especially Dr R.J. Pine, Professor B. Voight and Dr W. Schoberg, I thank also my close colleagues and associates John Hutchinson, Michael Kennard, Richard Pugh, Len Threadgold, Martin Chandler, Nick Lambert and Neil Dixon, and more latterly, Ross Sandman, Mike Cooper and Helen Rendell.

ENB

Contents

| | | |
|----------|---|-----------|
| 1 | An introduction to slope instability | 1 |
| 1.1 | Slope instability and landslides | 1 |
| 1.2 | Classification for mass movement: falls | 2 |
| 1.3 | Classification for mass movement: slides | 7 |
| 1.4 | Classification for mass movement: flows | 18 |
| 1.5 | Cost and frequency of occurrence: failures of natural slopes and of man-made slopes | 19 |
| 1.6 | Some disasters and their impact on knowledge | 22 |
| 1.7 | History of the understanding of slope stability | 23 |
| 1.8 | Previous work | 28 |
| 1.9 | Outline of the structure of the book | 29 |
| | | |
| 2 | Natural slopes | 31 |
| 2.1 | Slopes showing a response to present-day conditions | 31 |
| 2.2 | Examples of slopes preserving evidence of former conditions | 35 |
| 2.3 | The impact of Pleistocene conditions on slope development | 36 |
| 2.4 | Types of failure and the importance of geological structure | 46 |
| 2.5 | Free degradation, colluvial and scree slopes: the abandoned cliff | 53 |
| 2.6 | Toppling failures and their occurrence | 59 |
| 2.7 | Rockslides, avalanches, and other rapid mass movements | 60 |
| 2.8 | Identifying and locating unstable slopes | 62 |
| 2.9 | Dating mass movement | 63 |
| | | |
| 3 | Fundamental properties of soil and rocks | 67 |
| 3.1 | Stress-strain properties of soils and rocks | 67 |
| 3.2 | Influence of effective stress on shear strength | 69 |
| 3.3 | Stress history effects: overconsolidation | 71 |
| 3.4 | Effect of drainage during shear | 72 |
| 3.5 | Progressive failure | 74 |
| 3.6 | Growth of slip surfaces: particle alignment | 77 |
| 3.7 | Residual strength | 81 |
| 3.8 | High sensitivity soils | 82 |
| 3.9 | Effect of discontinuities on shear strength: soils | 83 |
| 3.10 | Effect of discontinuities: rocks | 84 |
| 3.11 | Other factors affecting shear strength | 85 |
| 3.12 | Parameters used in stability analyses | 86 |

| | | |
|----------|---|------------|
| 4 | Measurement of shear strength | 88 |
| 4.1 | Measurement of the peak strength of soils and rocks | 88 |
| 4.2 | Laboratory strengths | 89 |
| 4.3 | Field tests | 93 |
| 4.4 | Measurement of residual strength | 95 |
| 4.5 | Strategies for obtaining the residual strength | 96 |
| 4.6 | Specimens with natural shear surfaces | 96 |
| 4.7 | Laboratory-formed shear surfaces | 98 |
| 4.8 | Experimental procedures for the ring shear test | 99 |
| 4.9 | Selection of a strain rate | 102 |
| 4.10 | Achieving adequate total deformation | 103 |
| 4.11 | Effect of strain rate on residual strength | 104 |
| 4.12 | Choice of testing method | 106 |
| 4.13 | Discussion of the applicability of laboratory measured strengths | 107 |
| 5 | Principles of stability analysis | 109 |
| 5.1 | Assessment of stability | 109 |
| 5.2 | The $f = \phi$ and conventional methods of analysis | 110 |
| 5.3 | Bishop's method | 115 |
| 5.4 | Application of computers | 116 |
| 5.5 | Spencer's method | 118 |
| 5.6 | Graphical wedge method | 119 |
| 5.7 | Janbu's method | 121 |
| 5.8 | Morgenstern and Price's procedure | 123 |
| 5.9 | Maksumovic's method | 129 |
| 5.10 | Sarma's method | 131 |
| 5.11 | Miscellaneous other methods | 134 |
| 5.12 | The infinite slope procedure | 135 |
| 5.13 | Toppling modes of failure | 137 |
| 5.14 | Mobilization of shear parameters | 139 |
| 5.15 | Corrections for end effects and curved shear strength envelopes | 140 |
| 6 | Techniques used in stability analysis | 142 |
| 6.1 | The search for the most critical slip surface | 142 |
| 6.2 | Tension cracks | 145 |
| 6.3 | Partly submerged slopes | 147 |
| 6.4 | Back analysis and internal force distribution | 149 |
| 6.5 | Seismic slope stability analyses | 152 |
| 6.6 | Rates and magnitudes of slope movements | 153 |
| 6.7 | Stability charts and their use in undrained analyses | 158 |
| 6.8 | Stability charts: effect of porewater pressures | 161 |
| 6.9 | Additional techniques for use with stability charts | 172 |
| 6.10 | Computer program for slope stability calculations using Bishop's method | 173 |
| 6.11 | Computer program using Janbu's method | 179 |

| | | |
|----------|---|------------|
| 7 | Water pressures in slopes | 185 |
| 7.1 | Introduction | 185 |
| 7.2 | Steady seepage | 186 |
| 7.3 | Boundary conditions | 189 |
| 7.4 | The finite-element method in seepage | 190 |
| 7.5 | Influence of variable permeability | 193 |
| 7.6 | Undrained porewater pressures | 194 |
| 7.7 | Changes in hydraulic boundary conditions | 196 |
| 7.8 | Time-dependent seepage | 197 |
| 7.9 | Rapid drawdown | 201 |
| 7.10 | Systematic analysis of seepage conditions | 203 |
| 7.11 | Field studies | 204 |
| 7.12 | Representation of porewater-pressure information | 205 |
| 7.13 | Pore water pressures for use in design | 208 |
| 7.14 | Design charts for estimating r_u | 210 |
| 7.15 | Case records of seepage in slopes | 214 |
| 8 | Remedial and corrective measures for slope stabilization | 222 |
| 8.1 | Introduction | 222 |
| 8.2 | Cut and fill solutions | 223 |
| 8.3 | The neutral line theory | 224 |
| 8.4 | Case records for the use of slope reprofiling | 228 |
| 8.5 | Rock and soil anchors | 234 |
| 8.6 | Additional factors in ground anchor design | 236 |
| 8.7 | Case records of ground anchoring in soil slopes | 240 |
| 8.8 | Drainage | 243 |
| 8.9 | Shallow drains | 244 |
| 8.10 | Deep drains | 245 |
| 8.11 | Trench drains | 251 |
| 8.12 | Drains to eliminate undrained construction porewater pressures | 257 |
| 8.13 | Drains in dams | 258 |
| 8.14 | Retaining walls in slopes | 261 |
| 8.15 | Use of geogrids in embankments | 264 |
| 8.16 | Temperature treatments and grouting for slope stabilization | 266 |
| 8.17 | Choice of a stabilization method | 268 |
| 8.18 | Rock slopes | 270 |
| 9 | Investigation of landslides | 272 |
| 9.1 | Land surface features: methods of mapping | 272 |
| 9.2 | Locating slip surfaces by surface measurement and inference | 276 |
| 9.3 | Direct logging of faces and cores | 278 |
| 9.4 | Compilation of the results of direct logging and boreholes | 282 |
| 9.5 | Instrumentation | 283 |
| 9.6 | Piezometers: types and response | 287 |

CONTENTS

| | | |
|-----------|---|------------|
| 9.7 | Historical research | 291 |
| 9.8 | Premonitory signs of slope instability | 292 |
| 9.9 | Landslide hazard and risk assessment | 294 |
| 9.10 | Courses of action | 295 |
| 10 | Failures in earthworks: case histories | 298 |
| 10.1 | Flow slides in tips and spoil heaps: The Aberfan tip failure of 1966 | 298 |
| 10.2 | Lessons from tip failures | 302 |
| 10.3 | Construction period failures of large earthfills: Carsington Dam | 304 |
| 10.4 | Construction period failures of large earthfills: Açu Dam | 312 |
| 10.5 | Lessons to be learnt from construction period failures of large earthfills | 313 |
| 10.6 | Construction failures in cut slopes with high brittleness: the Panama Canal | 314 |
| 10.7 | Lessons to be learnt from construction failures in cut slopes with high brittleness | 317 |
| 10.8 | Small scale earthworks failures and the Selbome experiment | 317 |
| 11 | Failures in natural slopes: case histories | 321 |
| 11.1 | Failure of a reservoir slope leading to overtopping: the Vaiont Dam | 321 |
| 11.2 | Lessons to be learnt from Vaiont | 326 |
| 11.3 | Construction problems in natural slopes: Sevenoaks road construction | 327 |
| 11.4 | Lessons to be learnt from Sevenoaks | 331 |
| 11.5 | Lower Greensand escarpment in south Kent | 331 |
| 11.6 | Active coastal landslide complexes: Folkestone Warren, Kent | 335 |
| 11.7 | Active coastal landslide complexes: Ventnor, Isle of Wight, and the Undercliff | 342 |
| 11.8 | Mountain avalanches: Andean sturzstroms and landslide dams | 349 |
| 12 | Design recommendations for man-made slopes | 353 |
| 12.1 | Embankment details | 353 |
| 12.2 | Foundation treatments | 354 |
| 12.3 | Cut slopes | 354 |
| 12.4 | Control of water in water-retaining embankments | 355 |
| 12.5 | Tips and spoil heaps | 356 |
| 12.6 | Control of construction with instrumentation | 357 |
| 12.7 | General considerations on the choice of factor of safety | 358 |
| 12.8 | Choice of factors of safety for stabilizing existing landslides | 360 |
| 12.9 | Choice of a factor of safety for earthworks | 361 |
| 12.10 | Checking and validation, especially of computer analyses | 362 |
| 12.11 | Conclusion | 367 |

CONTENTS

| | | |
|--|---|------------|
| Appendices | | 369 |
| A | Equations in the Morgenstern and Price method | 369 |
| B | Derivation of force and moment equilibrium equations in Makrúmovic's method | 378 |
| C | Displacement of a slide under a single acceleration pulse | 382 |
| D | Sama's non-vertical slice method | 384 |
| E | A note on r_u | 387 |
| References | | 388 |
| Subject index | | 399 |
| Index to place names | | 408 |
| Index of geological units and names | | 410 |
