Preface xv

Introduction to Stress and Strain 1

CHAPTER 1

1.1 Introduction to the Mechanics of Solids 1
1.2 Uniaxial Normal Stress and Uniaxial Deformation 4
1.3 Shear Stress and Shear Strain 11
1.4 Allowable Loads 17
1.5 Tensile Stress-Strain Test 20
1.6 Problem Solving 25
1.7 Summary of Appendices 26
Problems 27

Uniaxial Loading and Deformation 39

CHAPTER 2

2.1 Introduction 39
2.2 Axial Deformation of a Bar 40
2.3 Analysis of Deformable Bodies 44
2.4 Statically Indeterminate Problems 48
2.5 Temperature Effects 59
2.6 Displacement Method for Axially Loaded Members 65
Derivation of Equations for Unknown Node Displacements
General Solution Procedure
2.7 Use of Computer Program BARMECH 71
To Use BARMECH
2.8 Differential Equations for Axial Force and Deformation 80
2.9 Concluding Remarks 86
Problems 87

CHAPTER 3

Torsion of Circular Shafts 115

3.1 Introduction 115
3.2 Geometry of Deformation 115
3.3 Stress Distribution and Equilibrium Requirements 118
3.4 Equations for Torsion of Circular Shafts 120
3.5 Torsion of Hollow Circular Shafts 123
3.6 Torsion of Statically Determinant Systems 125
3.7 Torsion of Statically Indeterminate Systems 132
3.8 Displacement Method for Torsion of Circular Shafts General Case 135
3.9 Computer Program TORMECH 139
3.10 Design of Circular Shafts for Power Transmission 146
3.11 Differential Equations for the Twisting Moment and Angle of Twist 149
3.12 Concluding Remarks 155
Problems 155

CHAPTER 4

Shear Forces and Bending Moments in Beams 176

4.1 Introduction 176
4.2 General Method 177
4.3 Shear Force and Bending Moment Diagrams 183
4.4 Differential Equilibrium Relations 190
4.5 Singularity Functions 202
4.6 Computer Method for Shear Force and Bending Moment Diagrams 211
4.7 Computer Program to Plot Shear Force and Bending Moment Diagrams 214
4.8 Three-Dimensional Problems 220
4.9 Concluding Remarks 222
Problems 223

CHAPTER 5

Stresses due to Bending 255

5.1 Introduction 255
5.2 Geometry of Deformation 256

5.3 Stress Distribution and Equilibrium Requirements 261
5.4 Stresses in Symmetric Elastic Beams with Variable Bending Moment 267
5.5 Shear Stress Distribution in Symmetric Beams with Variable Bending Moment 282
5.6 Built-up Beams 295
5.7 Concluding Remarks 301
Problems 302

CHAPTER 6

Deflections of Statically Determinate Beams 340

6.1 Introduction 340
6.2 Differential Equations for the Deflection of Beams 340
6.3 Beam Deflections by the Method of Double Integration 344
6.4 Beam Deflections by Direct Integration of the Load-Deflection Equation 358
6.5 Method of Superposition 370
6.6 Concluding Remarks 375
Problems 376

CHAPTER 7

Deflections of Statically Indeterminate Beams 406

7.1 Introduction 406
7.2 Deflections of Statically Indeterminate Beams 407
7.3 Method of Superposition 416
7.4 Displacement Method for Beams 420
7.5 Derivation of Equations Relating Element End Shear Forces and Bending Moments to Element End Deflections and Slopes 423
7.6 Application of the Force-Deformation Relations—Single-Element Beam Problems 426
7.7 Application of the Force-Deformation Relations—Two-Element Beam Problems 430
7.8 Use of Computer Program BEAMMECH to Calculate Beam Deflections, Slopes, Shear Forces, Bending Moments, and Maximum Bending Stresses 433
7.9 Concluding Remarks 450
Problems 451

CHAPTER 8

Stress and Strain 483

8.1 Introduction 483

Part A: Stress

8.2 Stress 484
8.3 Plane Stress 491
8.4 Stress Components Associated with Arbitrarily Oriented Faces in Plane Stress 492
8.5 Principal Stresses and Maximum Shear Stress 499
Principal Stresses
Maximum Shear Stress
8.6 Mohr's Circle Representation for Plane Stress 509
8.7 Mohr's Circle Representation for a General State of Stress 516
8.8 Stresses in Thin-Walled Pressure Vessels 526
Spherical Pressure Vessels
Cylindrical Pressure Vessels

Part B: Strain

8.9 Deformation 534
8.10 Plane Strain 535
8.11 Relation between Strain and Displacement in Plane Strain 536
8.12 Strain Components Associated with Arbitrary Sets of Axes 542
8.13 Strain Gage Measurements 548

Part C: Elastic Stress-Strain Relations

8.14 Elastic Stress-Strain Relations 552
Two-Dimensional Stress-Strain Relations
8.15 Criteria for Initial Yielding 565
8.16 Concluding Remarks 570
Problems 571

CHAPTER 9

Analysis of Combined States of Stress 598

9.1 Introduction 598
9.2 Combined Bending and Axial Loads 600
9.3 Combined Torsion and Axial Loads 604
9.4 Combined Bending and Torsion of Circular Shafts 612

9.5 Other Combined-Stress Examples 619
9.6 Concluding Remarks 626
Problems 626

Buckling and Stability 650

CHAPTER 10

10.1 Introduction 650
10.2 Examples of Instability 652
10.3 Bar-Spring Models for Stabiilty Analysis 653
10.4 Elastic Stability of Flexible Columns—Some Special Cases 660
Columns with Both Ends Pinned
Columns with One End Clamped and the Other End Free
10.5 Elastic Stability of Flexible Columns—General Approach 669
10.6 Columns with Eccentric Loads 674
10.7 Secant Formula for the Maximum Stress 679
10.8 Elastic Postbuckling Behavior 684
10.9 Concluding Remarks 691
Problems 692

APPENDICES 711

A Centroids and Moments of Inertia for Plane Areas 711
B Conversion Factors Useful for Mechanics of Solids 721
C Properties of Selected Structural-Steel Shapes 722
D Section Properties of Sawn Lumber and Timber 738
E Section Properties of Common Piping Sections 739
F Typical Mechanical Properties of Selected Materials 741
G Deflections and Slopes of Beams 746
H Instructions for Running the Programs Given on the Diskette 750
I Summary of Computer Programs on MECHMAT Diskette, Menus for Each Program 752
J Instructions for Running Specific Programs on the Diskette with Reference to Text Examples 757

Solutions to Selected Problems 761
Index 795
