

Multidimensional Continued Fractions

Fritz Schweiger

*Professor of Mathematics and Mathematics Education
University of Salzburg*

OXFORD
UNIVERSITY PRESS

Contents

1	Piecewise fractional linear maps	1
2	Brentjes' formalism	8
3	Ergodic theory of fibred systems	16
4	Jacobi–Perron algorithm	24
4.1	Basic definitions	24
4.2	Convergence results	29
4.3	Ergodic properties	36
5	Gutting's algorithm	37
6	Brun's algorithm	45
6.1	Subtractive version	45
6.2	Multiplicative acceleration	48
7	Selmer's algorithm	53
7.1	Subtractive version	53
7.2	The division algorithm	61
8	Generalized subtractive algorithms	62
9	Fully subtractive algorithms	69
10	Skew products	82
11	Continued fractions on simplices	87
11.1	Fractional linear maps	87
11.2	Interval exchange transformations	93
12	The convergence method of Greiter	102
13	Periodic expansions	111
14	Convergence and rational dependence	120
15	Diophantine approximation	127
15.1	Exponents of approximation	127
15.2	Perron's identity	131
15.3	Results on convergence	132
16	The second Lyapunov exponent	140
17	Periodic Jacobi–Perron algorithms	146
18	Convergence for periodic expansions	157

19 Volume as a measure of approximation	164
20 Complex continued fractions	170
21 The Poincaré algorithm	182
22 Dimension of exceptional sets	201
22.1 Introduction	201
22.2 The Dirichlet series of a set	202
23 A Kazmin theorem	209
24 Some applications	220
References	224
Index	233
